

TSUBAKI GEAR MOTORS 40 W–5.5 kW

Helical Gear / Hypoid Gear / Worm Gear
Full Lineup of IE3 Motor Compatible Models

High-end-spec gear solutions— Ultimate in function, quality, and performance

Helical Gear

Low noise, high efficiency

This parallel-shaft gear motor offers low noise, high efficiency, and easy installation. It's light, compact, and highly functional. Of course, Tsubaki's state-of-the-art technology ensures the motor is silent, highly efficient, and easy to maintain.

Parallel shaft

Motor 0.1 kW–2.2 kW

Reduction ratio 1/5–1/200

- Foot mount
- Face mount
- Flange mount

Hypoid Gear

Compact design

Offering highly efficient startup and operation, as well as excellent space savings. The reduced height allows it to be installed in a wider range of applications.

Right-angle

Motor 40 W–5.5 kW

Reduction ratio 1/5–1/1200

- Hollow shaft
- Foot mount
- Face mount

Worm Gear

Silent, self-locking

This right-angle gear motor uses single-step reduction for a high reduction ratio, and it has a shorter length. Outstanding features include silence, a self-lock function, and a robust gear structure.

Right-angle

Motor 0.1 kW–5.5 kW

Reduction ratio 1/10–1/300

- Hollow shaft
- Foot mount
- Face mount

Tsubaki small-sized gear motors bring together our wealth of know-how and advanced technologies. Choose a high-end-spec gear solution that offers the ideal function, quality, and performance for your application.

Gear Motor TA Series

0.1 kW–0.4 kW

Gear Motor TR Series

0.75 kW–2.2 kW

Hypoid Motor TA Series

0.1 kW–0.4 kW

Hypoid Motor TR Series

0.75 kW–5.5 kW

Hypoid Motor Mini Series

40 W–90 W

Croise Motor CSMA Series

0.1 kW–0.55 kW

Croise Motor HCMA Series

0.1 kW–0.55 kW

CSMR Series

0.75 kW–5.5 kW

HCMR Series

0.75 kW–5.5 kW

Wide range of applications

Choose from our extensive lineup for the product that fits your exact application and usage conditions.

- Inverter motor
- Clutch/brake
- Rotary encoder
- SHOCK GUARD
- SHOCK RELAY
- Outdoor use
- Waterproof

Available colors

Use three criteria to choose the product that's right for you

Basic specifications

Tsubaki small-sized gear motors respond to the exacting needs of all fields and industries. Depending on your needs, make selections based on three criteria—the type of gear, motor, and output—and we'll provide you with a small-sized gear motor made just for you.

Gear type (three)

- **Helical gear**
(Low noise, high efficiency)

- **Hypoid gear**
(Extremely compact)

- **Worm gear**
(Practically silent, self-locking)

Motor type

- Standard
- Highly efficient motor (IE3)
- Inverter
- Adapter flange
- Compliant with various country standards

Output type

- Foot mounting
- Shaft mounting
- Face mounting
- Flange mounting

You need a small-sized gear motor for a specific environment, purpose, and application. And with Tsubaki's three-criteria selection process, we can provide you with exactly what you need—a product made for you that's just right for you.

Plus α Series

The optimal combination of Tsubaki proprietary technologies—with regards to motor type, rotation detection, overload protection, and other factors—goes into making a small-sized gear motor that is ideal for your usage environment and application. You can choose the Plus α Series to further optimize the product to the application at hand.

Overload protection device

- SHOCK RELAY • SHOCK GUARD

Rotation signal detection

- Rotary encoder • Pulsacion

Other

- Hollow-shaft keyless model (with POWER-LOCK)

See pp 5–6 for details. \

Just Fit Models

Tsubaki's Just Fit Models incorporate any of a wide range of specifications that customers need to realize products that are custom-made to meet the specialized needs of any and every industry.

The Just Fit Model logo shows that a product has specifications custom-made to the needs of a particular industry.

- Waterproof
- Food contact
- Food conveyor
- Heat-resistant
- Cold-resistant
- International compliance

See pp 7–8 for details. \

Plus α Series – Add functions and value to your small-sized gear motor

Plus α Series

SHOCK RELAY type

A reducer is equipped with an electric overload protection device. In case the motor current exceeds the set value due to an overload, SHOCK RELAY functions after a given time to stop the motor directly, thus protecting the machinery.

Features

- The Shock Relay is built into the motor's terminal box, meaning no extra control panel is needed
- The motor is instantly and directly stopped upon detection of the motor's current, so no sequence circuit is needed
- Trip signal (1c contact) output can be utilized, for example, for an alarm lamp or to stop the motor
- After eliminating the cause of the overload, the motor restarts simply by turning on the power
- Compliant with CE

SHOCK GUARD type

A product can be equipped with a mechanical overload protection device (SHOCK GUARD) developed exclusively for the hollow output shaft. In case of unexpected overload, SHOCK GUARD activates to protect the machinery device.

Features

- After the cause of the overload is eliminated, the motor automatically re-engages and starts operation
- Unique alignment of the ball and pocket gives a one-to-one combination of engaging positions
- Simply rotate the adjustment nuts to adjust the trip torque
- If combined with non-contact SHOCK GUARD sensors, an overload can be detected and the motor can be stopped or an alarm set off

We can add proprietary Tsubaki technologies to your small-sized gear motor to give it added value in the form of overload protection, rotation detection, fewer parts, and space saving. The result is the optimal solution for any and every application.

Pulsacion type

The motor has an integrated sensor that detects a permanent magnetic pole located on the motor shaft as a pulse string. With dimensions nearly identical to those of standard gear motors, the product can be used outdoors and under wet conditions.

Features

- Ideal for detecting digital signals for things such as speed control, position control, and speed display
- The encoder is directly installed in the motor shaft, so no coupling connection is needed

Application

Automated stacker crane

Applications

- Multi-story warehouses
- Stacker cranes
- Multi-story parking lots
- Conveyors

Setting distance of work movement

Packaging machinery

Applications

- Automated machinery
- Constant-size cutter
- Printers
- Packaging machinery

Rotary encoder type

By incorporating a rotary encoder on the motor shaft and utilizing the rotation signals of a gear motor, various processes can be automated and operation streamlined.

Hollow-Shaft POWER-LOCK type

A special hollow shaft with POWER-LOCK enables keyless locking. Mounting and unmounting are easy, and there's no need for phase focusing. This reduces the number of machinery device parts and saves space.

Features

- There's no need for a keyway on the driven shaft
- Mounting and unmounting of the reducer are easy
- There's no backlash with the driven shaft
- A special safety cap is available
- Reduces the number of parts and operational man-hours

Just Fit Models—For equipment that's a perfect fit

Just Fit Model

The Just Fit Model logo shows that a product has specifications custom-made to the needs of a particular industry.

Waterproof specifications

Our product lineup boasts waterproof specifications with an IP65 rating. This means they can be subject to splashing and can be washed directly with water.

Options

- **Stainless steel shaft**
- **With brake**
- **Fin-less motor frames**

Gear Motor TA Series

Croise Motor

Hypoid Motor TA Series

Food contact and food conveyor specifications

Our products use the H1 food-grade lubricant, certified by NSF International. You therefore get safety and reliability in applications where food is being conveyed.

- **Uses H1 food-grade lubricant for food machinery**
- **Aluminum diecast terminal box**
- **Antibacterial powder coating**
- **Long-life oil seal**
- **Fin-less motor frame for easy cleaning**
(Food conveyor specifications only)

Hypoid Motor TA Series

Tsubaki has an extensive lineup of Just Fit Model products with international specifications that comply with standards for things like waterproofness, food processing applications, and specific country regulations. We provide solutions that meet your exact device needs.

Heat-/cold-resistant specifications

Heat resistance at between 0°C and 60°C, cold resistance at between -30°C and 40°C. Each product proves its worth in specific environments.

Heat resistance

Cold resistance

International compliance specifications

Our motors conform to international standards such as CE in Europe, UL in the US, and CCC in China.

US, Canada: UL compliant

UL (Underwriters Laboratories) is an American third-party organization that tests and approves products for consumer safety. Our C-UR model has been approved by UL, as well as by the CSA (Canadian Standards Association).

Europe: CE compliant

Products exported to Europe must bear CE marking to show that they satisfy the safety requirements of applicable EC directives.

TRIPLE200

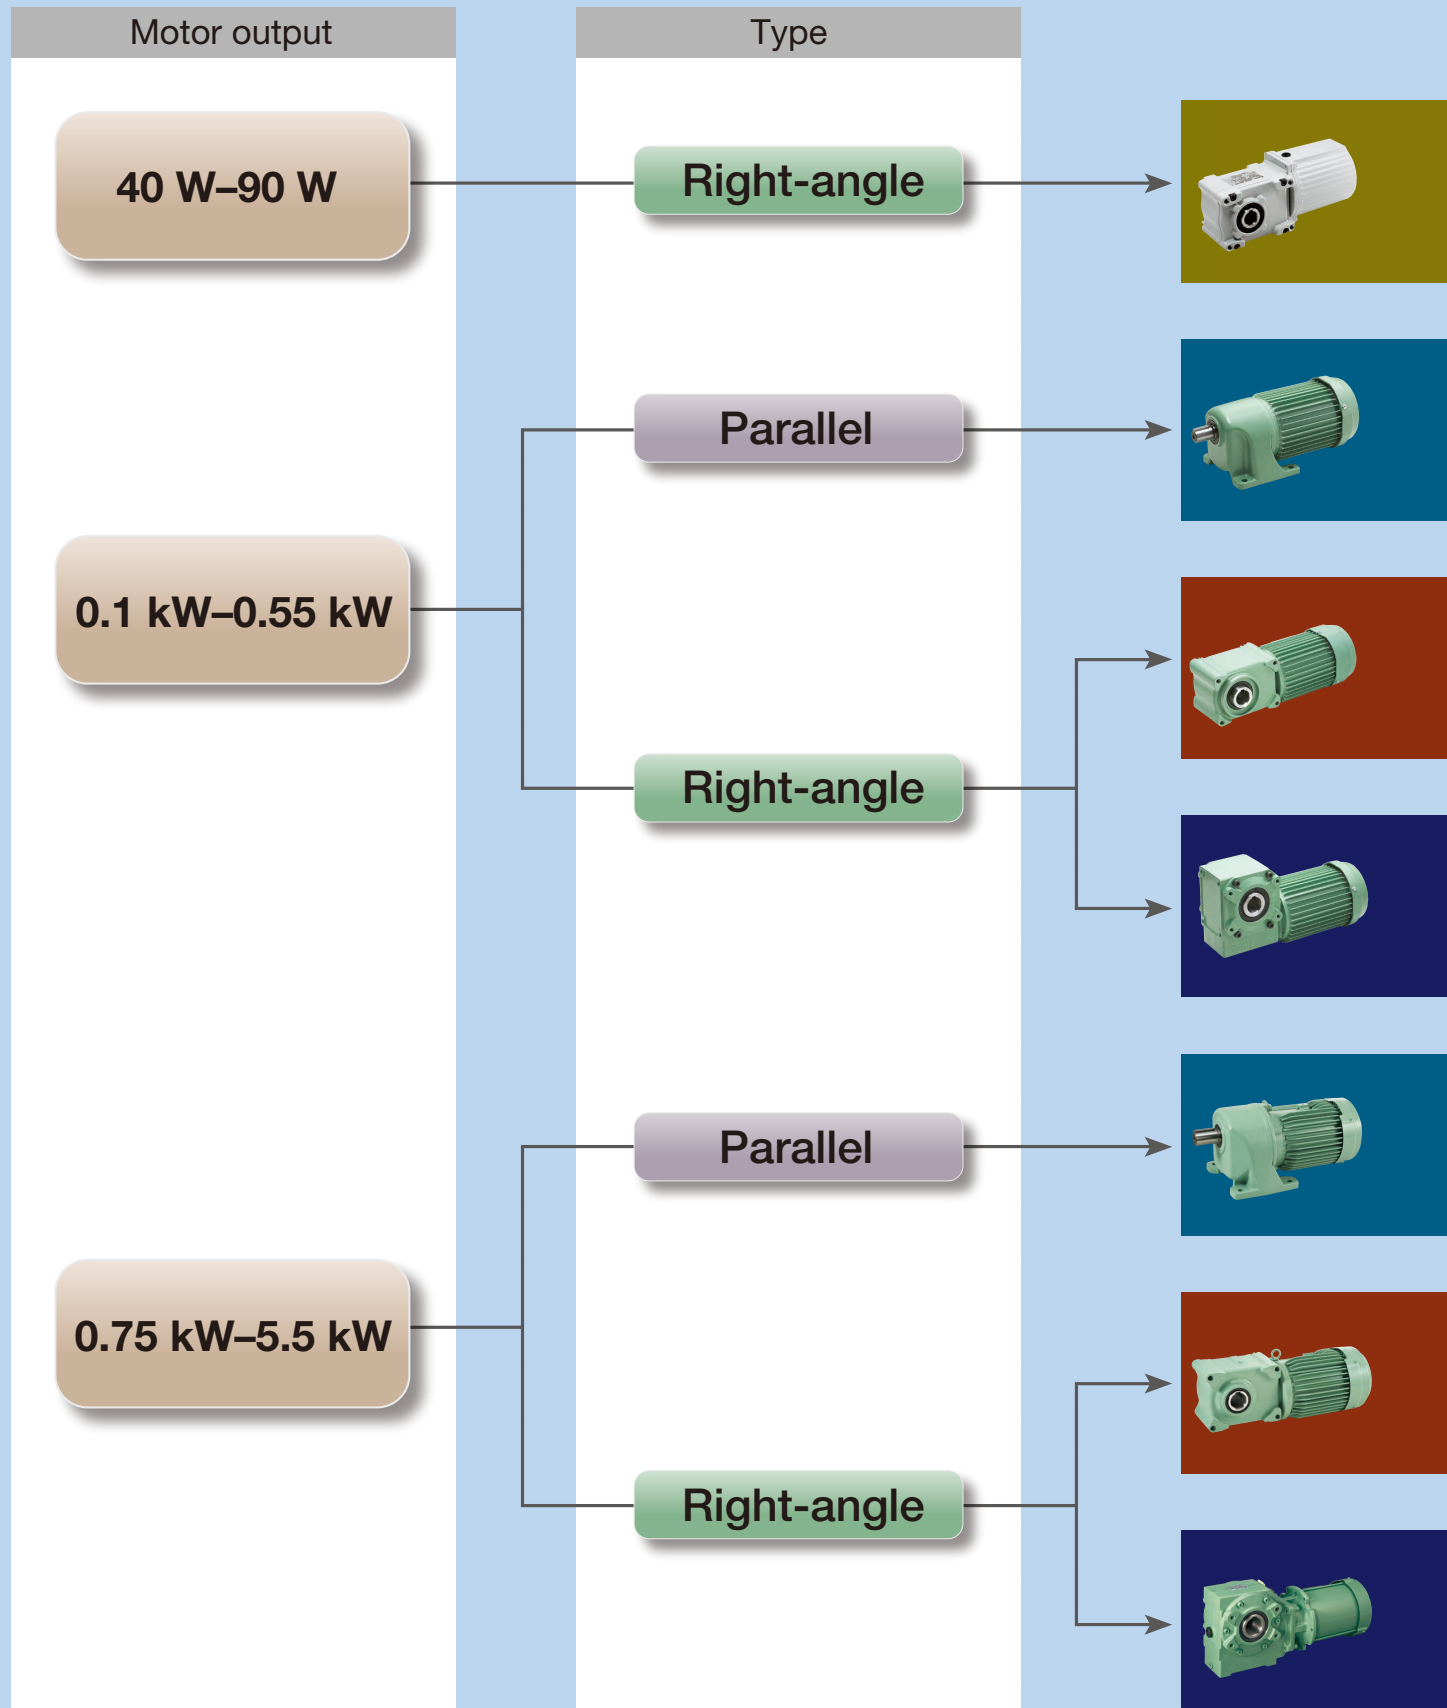

Triple 200

Triple 200 is a Tsubaki motor specification that satisfies all the requirements of CE, UL, and CCC, so that customers don't need to worry about complying with each of these standards separately.

China: CCC compliant

Motors 1.1 kW and smaller exported to China must bear the CCC mark to show that they satisfy the CCC system for product quality standardization.

GEAR MOTOR

TA and TR Series Features

Gear Motor TA and TR Series Features

Reducer basics

0.75 kW to 2.2 kW: IE3

Compact

Three-phase 0.1 kW to 2.2 kW

Helical Gear, Parallel Shaft

1 Low noise, long life

With our proven experience in low-noise design and manufacturing technologies, we have achieved low-noise, long-life gear motors.

2 Compact, light weight

An aluminum-frame motor results in smaller, lighter gear motors.

3 Extensive applications

Our gear motors come in a wide range of outputs and reduction ratios—from 1/5 to 1/200—to meet a variety of application needs.

4 Environmentally friendly

The use of electrostatic powder coating has improved the coating quality and, since it uses no thinner, has reduced VOC emissions (for three-phase models below 0.75 kW and 1/75). By switching from using wood and bolts in packaging to using cardboard boxes and film wrapping instead (for products weighing less than 30 kg), we have helped customers reduce the amount of waste they generate.

5 Usability

Frame numbers are shown on model numbers. Tap processing is standard on the output shaft edges. Face mounting is also available as standard, which allows easy securing of bolts by pushing them from the output shaft side through screw holes located on a mounting surface of the gear case.

6 Inverter motor equipped (0.1 kW to 0.4 kW)

The inverter-compatible motor can be directly connected, and it can be furnished with the same dimensions as standard motors. Even in the low frequency range (6 Hz and more), continuous operation at 100% constant torque is possible. The more-than 0.75 kW model with IE3 motor has the same characteristics as the inverter motor model.

7 Range of options

We can provide you with any of a number of proprietary options to match the product to fields such as environment, food processing, and bread making.

Terminal box positions and lead outlet directions

1. Terminal box position codes

Standard	P1 (90° swing)	P2 (180° swing)	P3 (270° swing)
			
All models	1.5 kW, 2.2 kW	0.1 kW, 0.2 kW 0.4 kW, 1.5 kW 2.2 kW	1.5 kW, 2.2 kW
P4 (60° swing)	P5 (120° swing)	P6 (240° swing)	P7 (300° swing)
			
0.1 kW, 0.2 kW 0.4 kW	0.1 kW, 0.2 kW 0.4 kW, 0.75 kW	0.1 kW, 0.2 kW 0.4 kW, 0.75 kW	0.1 kW, 0.2 kW 0.4 kW

Note 1: The above diagrams are typical examples. The position of the terminal box will vary depending on the model number. Please confirm dimensions.
 Note 2: On the 0.75 kW, 1/5-1/25 foot mount types, the motor protrudes from the mounting surface in the P5 position.
 Note 3: The P6 and P7 positions may not be possible for the 0.1 kW and 0.2 kW foot mount types.

2. Terminal box outlet direction

The positions shown below are obtained by sequentially swinging the lead outlet clockwise, as viewed facing the terminal box, by 90 degrees from the standard position of the lead outlet.

0.1 kW to 0.4 kW: Outdoor type, hard terminal box

Note: For standard motors (with resin terminal box), change the direction of the lead outlet by changing the terminal box top cover mounting direction.

0.75 kW to 2.2 kW: Standard model, outdoor terminal box

Specifications

Motor	Output	Three-phase: 0.1, 0.2, 0.4 kW: IE1, 0.75, 1.5, 2.2 kW: IE3

				7.5	9	735	{ 75.0 }	*613	*{ 62.5 }	9800	{ 1000 }		

Note 1: The nominal reduction ratio is shown as the reduction ratio.

Note 2: The output shaft revolution rate is calculated by dividing the motor synchronous revolution rate by the nominal reduction ratio.

For the actual reduction ratio, refer to page 36. Calculate the actual output revolution rate from the motor's rated revolution rate.

Note 3: The models marked with * are ones for which torque is limited.

Outline Dimensions

GMTR075-28L5 - 25 (B)

Reduction ratio : 5, 10, 15, 20, 25 Approx. weight : 19.0(22.0)kg

GMTR075-38L30 - 75 (B)

Reduction ratio : 30, 40, 50, 60, 75 Approx. weight : 23.0(26.0)kg

GMTR075-42L100 - 200 (B)

Reduction ratio : 100, 120, 165, 200 Approx. weight : 47.0(50.0)kg

Note 1: The values in parentheses are for brake-equipped models.

Note 2: On the GMTR075-28L5-25, the motor protrudes from the mounting surface in the terminal box P5 position.

Note 1: The nominal reduction ratio is shown as the reduction ratio.

Note 2: The output shaft revolution rate is calculated by dividing the motor synchronous revolution rate by the nominal reduction ratio.

For the actual reduction ratio, refer to page 36. Calculate the actual output revolution rate from the motor's rated revolution rate.

Note 3: The models marked with * are ones for which torque is limited.

Outline Dimensions

GMTR075-28U5 - 25 (B)

1

Reduction ratio : 5, 10, 15, 20, 25 Approx. weight : 19.0(22.0)kg

GMTR075-38U30 - 75 (B)

2

Reduction ratio : 30, 40, 50, 60, 75 Approx. weight : 23.0(26.0)kg

GMTR075-42F100 - 200 (B)

3

Reduction ratio : 100, 120, 165, 200 Approx. weight : 47.0(50.0)kg

Note: The values in parentheses are for brake-equipped models.

Specification Chart	Page 35
Outline Dimensions	Page 37
(Foot Mount Type, Face Mount Type, Flange Mount Type)	

Adapter Type

0.1 kW to 2.2 kW

- Reducer with adapter flange allows motor to be attached
 - Non-Tsubaki motors as well
 - Explosion-proof motors
 - Other special motors
- Applicable to IEC or JEM standard flange motors
 - Compatible with keyless D-cut shafts under 0.2 kW

- If you require compatibility with servomotors or DC motors with special flange dimensions or shaft dimensions, please contact Tsubaki.

Inline Reducer Type

0.1 kW to 2.2 kW

Reducer with reducer part of gear motor separated.
Use in following cases:

- When a parallel, high-efficiency reducer is necessary
- When a reducer is driven by a device other than special motors or electric motors
- When input revolution speed is different from the motor revolution speed

Relation between Input Shaft Revolution Speed and Allowable Output Shaft Torque

The allowable output shaft torque shown in the specification chart is for input shaft revolution speeds of 1500 r/min (50 Hz) or 1800 r/min (60 Hz). When the input shaft revolution speed is other than these, the values shown in the specification chart should be multiplied by the torque correction coefficient shown in the figure below to obtain the allowable output shaft torque.

Allowable output shaft torque correction coefficient by input shaft revolution speed

(Example)

When the GRTA010-18L50 is used at an input shaft revolution speed of 2500 r/min. According to the figure to the left, the correction coefficient for an input shaft revolution speed of 2500 r/min is 0.65.

$$\begin{aligned} \text{Allowable output shaft torque} &= 28.4 \times 0.65 = 18.46\text{N} \\ &\quad \{2.9 \times 0.65 = 1.88\text{kgf}\cdot\text{m}\} \end{aligned}$$

$$\begin{aligned} \text{Allowable output shaft O.H.L.} &= 1264 \times 0.65 = 821.6\text{N} \\ &\quad \{129 \times 0.65 = 838\text{kgf}\} \end{aligned}$$

$$\begin{aligned} \text{Allowable input shaft O.H.L.} &= 96.0 \times 0.65 = 62.4\text{N} \\ &\quad \{9.8 \times 0.65 = 6.37\text{kgf}\} \end{aligned}$$

Note 1: The correction coefficient shown in the figure above is also applied to the allowable input/output shaft O.H.L.

Note 2: For the inertia ratio and allowable starting frequency, refer to Table 3 on page 206.

Note 3: If the device is to be used as a step-up gear, please contact us.

HYPOID MOTOR

TA and TR Series Features

Hypoid Motor TA and TR Series Features

0.75 kW to 5.5 kW: IE3

Three-phase 0.1 kW to 5.5 kW Hypoid gears and right-angle reducer result in space savings and a single product with multiple uses.

1 High efficiency

Less sliding and greater efficiency compared to a worm gear. At the same output, there is less power consumption and greater cost effectiveness.

2 Low noise

Tsubaki's know-how in gear motor processing technology ensures low noise and high reliability.

3 Usability

The grease is already encapsulated so it's ready to use. It can be installed in any direction. Tap processing is standard on the output shaft edges. For the hollow type shaft, the torque arm and shaft edge cover are available as options.

Hypoid Gear, Right-Angle Shaft

4 Inverter motor equipped (0.1 kW to 0.4 kW)

The inverter-compatible motor can be directly connected. Even in the low frequency range (6 Hz and more), continuous operation at 100% constant torque is possible. Dimensions are exactly the same as those of the standard model. See page 288 for details.

The more-than 0.75 kW model with IE3 motor has the same characteristics as the inverter motor model.

5 Compact

Emphasis has been placed on reducing the height of the hypoid motor so as to create a low, compact reducer.

Space savings

Mounted inside of conveyor belt

Mounted outside of conveyor belt

Multiple drive

Multi-fit system

Face mounting means compactness. Minimal dead space means it's easy to move.

Identical upper and lower pitches means two can be installed in a mirror configuration.

Three ways to attach the main unit

Mounted outside of conveyor belt

Mounted inside of conveyor belt

Mounted on shaft

Options

Mounted on shaft with torque arm

Security with safety shaft edge cover

Safety shaft edge cover

5.5kW	55H																						

Note: Reduction ratios 1/7.5 and 1/12.5 are for 0.1 kW–0.75 kW models.

Three-phase motor: Face mount type (Non-brake type, brake type)

	5	10	15	20	25	30	40	50	60	80	100	120	160	200	300	360	480	600	720	960	1200
0.1kW	22U												24U		28U		38U				
0.2kW	22U						28U						38U		42U						
0.4kW	28U						38U						42U		50U						
0.75kW	38U						42U						50U								
1.5kW	42U						50U														
2.2kW	42U						50U														
3.7kW	50U																				
5.5kW	50U																				

Three-phase motor: Foot mount type (Non-brake type, brake type)

	5	10	15	20	25	30	40	50	60	80	100	120	160	200	300	360	480	600	720	960	1200
0.1kW	22L												24L		28L		38L				
0.2kW	22L						28L						38L		42L						
0.4kW	28L						38L						42L		50L						
0.75kW	38L						42L						50L								
1.5kW	42L						50L														
2.2kW	42L						50L														
3.7kW	50L																				
5.5kW	50L																				

Terminal box positions and lead outlet directions

1. Terminal box position codes

Note: On the 0.75 kW and 1.5 kW foot mount types, the motor protrudes from the mounting surface when the terminal box is at a position other than the standard position.

Note: On 0.1 kW and 0.2 kW models with reduction ratios of 1/300 to 1/2000, the terminal box inclines 15° horizontally, as shown in the figure below. (D1 and D3 are for outdoor types and models with a hard terminal box.)

2. Terminal box outlet direction

The positions shown below are obtained by sequentially swinging the lead outlet clockwise, as viewed facing the terminal box, by 90 degrees from the standard position of the lead outlet.

0.1 kW to 0.4 kW: Outdoor type, hard terminal box

Note: For standard motors (with resin terminal box), change the direction of the lead outlet by changing the terminal box top cover mounting direction.

0.75 kW to 5.5 kW: Standard model, outdoor terminal box

Note: On 0.75 kW non-brake types and 1.5 kW–2.2 kW brake types, changing the lead outlet direction will change the center of the terminal box.

Specifications

Motor	Output	Three-phase: 0.1, 0.2, 0.4 kW: IE1, 0.75, 1.5, 2.2, 3.7, 5.5 kW: IE3 Non-brake type, Brake type
	Power supply	0.1 kW-5.5 kW, 200/200/220 V, 50/60/60 Hz
	Number of poles	4
	Protection	0.1 kW: Totally enclosed type (IP44), 0.2 kW-5.5 kW: Totally enclosed external fan type (IP44)
	Cooling	0.1 kW: Self-cooled type (IC410), 0.2 kW-5.5 kW: Self-managed type (IC411)
	Startup	—
	Rating	S1 (continuous)
	Insulation	0.1 kW-0.4 kW: 120 (E), 0.75 kW: 155 (F), 1.5 kW-5.5 kW: 130 (B)
	Brake	Non-excitation operation, DC electromagnetic brake
Reducer	Reduction ratio	1/5 to 1/1200
	Lubrication	Grease
	Start end keyway	New JIS key (JISB1301-1976): Output shaft key attached (Ordinary-class keyway, except hollow shaft type)
	Output shaft end	Tapped (except hollow shaft type)
Ambient conditions	Installation place	Indoor not exposed to dust or water
	Temperature	-20°C to 40°C
	Humidity	Less than 85% (non condensing)
	Altitude	Elevations below 1000 m
	Atmosphere	Free from corrosive gases, explosive gases, and steam
	Mounting direction	No limitations on mounting angles: horizontal, vertical, or inclined
Paint color	Munsell 2.5G 6/3	

Note: The protective construction for the brake type is IP20.

Motor Specifications (0.1 kW-0.4 kW)

Number of phases	Output	Number of poles	Frequency Hz	Voltage V	Rated current A	Rated revolution r/min	AC-side brake current Reference value at 20°C
Three-phase	0.1kW	4	50/60/60	200/200/220 (400/400/440)	0.63/0.57/0.58 (0.32/0.29/0.29)	1420/1680/1710 (1440/1740/1740)	0.12

	5.5kW				22.6/20.8/20.0 (11.3/11.3/10.4/10.0)	1465/1760/1765 (1460/1465/1760/1765)	91.2/92.1/92.4 (91.2/91.2/92.1/92.4)		0.10

Note 1: The values in parentheses under "Rated current" and "Rated revolution" for 0.1 kW-0.4 kW are for 400/400/440 V.
 Note 2: The values in parentheses under "Rated current" and "Rated revolution" for 0.75 kW-5.5 kW are for 380/400/400/440 V.
 Note 3: For the brake-type models, the brake current shown above is added for the phase where the brake lead wire is connected to the motor lead wire. The AC-side brake current is for 200 V AC 60 Hz.
 Note 4: The specifications for 0.75 kW-5.5 kW are the IE3 motor specifications for the Japanese market.
 Please refer to other information to confirm that products comply with global voltage requirements.

1200	1.3	1.5	*621	{63.4}	*621	{63.4}	6272	{640}							

Note 1: The actual reduction ratio is shown as the reduction ratio. (They are all integer ratios.)
 Note 2: The output shaft revolution rate is calculated by dividing the synchronous motor revolution rate by the reduction ratio. Calculate the actual output revolution rate from the motor's rated revolution rate (page 53).
 Note 3: For output shaft arrangement "T" where torque is applied to both shafts, the sum of both torques should be equal to or less than the value shown in the table above. In addition, the O.H.L. on one shaft should be equal to or less than 1/2 of the value shown in the table above.
 Note 4: The models marked with * are ones for which torque is limited.
 Note 5: Reduction ratios 1/7.5 and 1/12.5 are for hollow shaft, three-phase motor types (non-brake or brake type) only.

Note 1: The actual reduction ratio is shown as the reduction ratio. Note that on the 2.2 kW, 1/50 model (marked with ★), the actual reduction ratio is 1/49.286.

Note 2: The output shaft revolution rate is calculated by dividing the synchronous motor revolution rate by the reduction ratio. Calculate the actual output revolution rate from the motor's rated revolution rate (page 53).

Note 3: For output shaft arrangement "T" where torque is applied to both shafts, the sum of both torques should be equal to or less than the value shown in the table above. In addition, the O.H.L. on one shaft should be equal to or less than 1/2 of the value shown in the table above.

Note 4: The models marked with * are ones for which torque is limited.

Note 1: The values in parentheses are for brake-equipped models with a fan cover. Refer to the previous page for the shape of the fan cover.
 Note 2: The dimension marked with * indicates that part of the motor protrudes from the mounting face.
 Note 3: For output shaft arrangement "T", the right and left output shaft keyways are not aligned precisely.
 Note 4: The direction of rotation of the output shaft is based on direction of rotation A shown on page 211.

			★1/120			15	18	*1068	{*109}	968	{98.8}	9800	{1000}	
			★1/120			12.5	15	*1176	{*120}	1166	{119}	9800	{1000}	

Note 1: The actual reduction ratio is shown as the reduction ratio. Note that on the 2.2 kW, 1/50 model (marked with ★), the actual reduction ratio is 1/49.286.

Note 2: The output shaft revolution rate is calculated by dividing the synchronous motor revolution rate by the reduction ratio. Calculate the actual output revolution rate from the motor's rated revolution rate.

Note 3: The models marked with * are ones for which torque is limited.

Note 4: For output shaft arrangement "T" where torque is applied to both shafts, the sum of both torques should be equal to or less than the value shown in the table above. In addition, the O.H.L. on one shaft should be equal to or less than 1/2 of the value shown in the table above.

Outline Dimensions

1200	1.3	1.5	*1176	*{120}	*1176	*{120}	9800	{1000}	4				

Note 1: The actual reduction ratio is shown as the reduction ratio. (They are all integer ratios.)

Note 2: The output shaft revolution rate is calculated by dividing the synchronous motor revolution rate by the reduction ratio. Calculate the actual output revolution rate from the motor's rated revolution rate.

Note 3: The models marked with * are ones for which torque is limited.

Note 4: For output shaft arrangement "T" where torque is applied to both shafts, the sum of both torques should be equal to or less than the value shown in the table above. In addition, the O.H.L. on one shaft should be equal to or less than 1/2 of the value shown in the table above.

Note 1: The actual reduction ratio is shown as the reduction ratio. (They are all integer ratios.)

Note 2: The output shaft revolution rate is calculated by dividing the synchronous motor revolution rate by the reduction ratio. Calculate the actual output revolution rate from the motor's rated revolution rate.

Note 3: For output shaft arrangement "T" where torque is applied to both shafts, the sum of both torques should be equal to or less than the value shown in the table above. In addition, the O.H.L. on one shaft should be equal to or less than 1/2 of the value shown in the table above.

Outline Dimensions

Adapter Type

0.1 kW to 1.5 kW

- Reducer with adapter flange allows motor to be attached
 - Non-Tsubaki motors as well
 - Explosion-proof motors
 - Other special motors
- Applicable to IEC or JEM standard flange motors
 - Compatible with keyless D-cut shafts under 0.2 kW

- If you require compatibility with servomotors or DC motors with special flange dimensions or shaft dimensions, please contact Tsubaki.

Inline Reducer Type

0.1 kW to 1.5 kW

Reducer with reducer part of hypoid motor separated.

Use in following cases:

- When a right-angle, high-efficiency reducer is necessary
- When a reducer is driven by a device other than special motors or electric motors
- When input revolution speed is different from the motor revolution speed

Relation between Input Shaft Revolution Speed and Allowable Output Shaft Torque

The allowable output shaft torque shown in the specification chart is for input shaft revolution speeds of 1500 r/min (50 Hz) or 1800 r/min (60 Hz). When the input shaft revolution speed is other than these, the values shown in the specification chart should be multiplied by the torque correction coefficient shown in the figure below to obtain the allowable output shaft torque.

Allowable output shaft torque correction coefficient by input shaft revolution speed

(Example)

When the HRTA010-24L50 is used at an input shaft revolution speed of 2500 r/min. According to the figure to the left, the correction coefficient for an input shaft revolution speed of 2500 r/min is 0.65.

$$\begin{aligned} \text{Allowable output shaft torque} &= 27.4 \times 0.65 = 17.81\text{N} \\ &\quad \{2.8 \times 0.65 = 1.82\text{kgfm}\} \\ \text{Allowable output shaft O.H.L.} &= 1862 \times 0.65 = 1210.3\text{N} \\ &\quad \{190 \times 0.65 = 123.5\text{kgf}\} \\ \text{Allowable input shaft O.H.L.} &= 96.0 \times 0.65 = 62.4\text{N} \\ &\quad \{9.8 \times 0.65 = 6.37\text{kgf}\} \end{aligned}$$

Note 1: The correction coefficient shown in the figure above is also applied to the allowable input/output shaft O.H.L.

Note 2: For the inertia ratio and allowable starting frequency, refer to Table 3 on page 206.

Note 3: If the device is to be used as a step-up gear, please contact us.

CROISE MOTOR Features

Croise Motor Features

0.75 kW to 5.5 kW: IE3

Compact

Three-phase 0.1 kW to 5.5 kW
Worm gear motors to meet
every customer need.

Worm Gear, Right-Angle Shaft

1 Right-angle shaft, high reduction ratio

Croise motors make use of worm gears to achieve space savings in equipment layout with right-angle shafts and high reduction ratios. The CSMA/CSMR series offers a reduction gear ratio of up to 1/60 in the first worm gear, and up to 1/300 in the HCMA/HCMR series with a combination of a helical gear and a worm gear in right-angle shaft models.

2 Compact

The simple structure of the CSMA series provides downsizing of the gear motor in total length. Adoption of a first helical gear in the HCMA series reduces the offset between the input shaft and the worm gear output shaft, providing even greater compactness in height.

3 Low noise

The worm gear mechanism offers smooth and quiet operation compared to other gear mechanisms. In addition, adoption of a silent-type brake eliminates harsh metallic clanking when activated.

4 Superior stopping accuracy

Backlash is minimal compared to other gear mechanisms, and excellent stop position accuracy can be expected.

5 High efficiency

At reduction ratios ranging from 1/10 to 1/60, the CSMA/CSMR series features high efficiency for a low reduction ratio range (1/10 to 1/30), and the HCMA/HCMR series for a high reduction ratio range (1/40 to 1/60).

6 Shock resistant

Compared with other gear mechanisms, worm gears have higher strength and excellent impact resistance.

Terminal Box Positions and Lead Outlet Directions

1. Terminal box position

- Standard
- P1: 90° swing
- P2: 180° swing
- P3: 240° swing

Note: On the CSMR075 foot mount types, the motor protrudes from the mounting surface when the terminal box is at a position other than the standard position.

2. Terminal box outlet direction

The positions shown below are obtained by sequentially swinging the lead outlet clockwise, as viewed facing the terminal box, by 90 degrees from the standard position of the lead outlet.

0.1kW to 0.55kW: Outdoor type, Hard terminal box

Note: For standard motors (with resin terminal box), change the direction of the lead outlet by changing the terminal box top cover mounting direction.

D1: 90° swing, D2: 180° swing, D3: 270° swing

0.75 kW to 5.5 kW: Standard model, outdoor terminal box

F1: 90° swing, F2: 180° swing, F3: 270° swing

3. Paint color [Standard color: Munsell 2.5G6/3]

C0: Light gray (Munsell N7.5), C1: Light silver metallic, C2: Ivory white, C3: Dark silver metallic

Reduction Ratio Combinations

CSMA/CSMR series

Reduction ratio	1/10	1/15	1/20	1/25	1/30	1/40	1/50	1/60
Worm gear	1/10	1/15	1/20	1/25	1/30	1/40	1/50	1/60

HCMA/HCMR series

Reduction ratio	1/40	1/50	1/60	1/75	1/90	1/100	1/120	1/150	1/180	1/200	1/240	1/300
Helical gear	1/4	1/5	1/4	1/5 (1/4)	1/4.5	1/5	1/4	1/5	1/4.5	1/5	1/4	1/5

0.2kW	13L			16L						16L			22L						28L		
0.4kW	16L			22L						22L			28L						32L		
0.55kW	16L			22L						22L	28L						32L	40L			
0.75kW	22L			28L						28L			32L			40L	50L				
1.5kW	28L			32L						32L	40L						50L				
2.2kW	32L			40L						40L			50L								
3.7kW	40L			50L						50L											
5.5kW	50L									50L			50L								

In the table above, frame numbers shown within (the heavy-border boxes) are integrated foot mount models.

Specifications

Motor	Output	Three-phase: 0.1, 0.2, 0.4, 0.55 kW: IE1, 0.75, 1.5, 2.2, 3.7, 5.5 kW: IE3 Non-brake type, Brake type
	Power supply	0.1 kW-5.5 kW, 200/200/220 V, 50/60/60 Hz
	Number of poles	4
	Protection	0.1 kW-5.5 kW: Totally enclosed external fan type (IP44)
	Cooling	0.1 kW-5.5 kW: Self-managed type (IC411)
	Rating	S1 (continuous)
	Insulation	0.1 kW-0.4 kW: 120 (E), 0.75 kW: 155 (F), 1.5 kW-5.5 kW: 130 (B)
	Brake	Non-excitation operation, DC electromagnetic brake
Reducer	Reduction ratio	1/10 to 1/300
	Lubrication	Oil bath
	Start end keyway	New JIS key (JISB1301-1976): Output shaft key attached (ordinary-class keyway)
	Output shaft end	Tapped
Ambient condition	Installation place	Indoor not exposed to dust or water
	Temperature	5°C to 40°C
	Humidity	Less than 85% (non condensing)
	Altitude	Elevations below 1000 m
	Atmosphere	Free from corrosive gases, explosive gases, and steam
	Mounting direction	No limitations on mounting angles: horizontal, vertical, or inclined
Paint color	Light green (Munsell 2.5G 6/3)	

Note: The protective construction for the brake type is IP20.

Motor Specifications

Motor specifications (0.1 kW-0.55 kW)

Number of phases	Output	Number of poles	Frequency Hz	Voltage V	Rated current A	Rated revolution r/min	AC-side brake current A Reference value at 20°C
Three-phase	0.1kW	4	50/60/60	200/200/220 (400/400/440)	0.63/0.57/0.58 (0.32/0.29/0.29)	1420/1680/1710 (1440/1740/1740)	0.12
	0.2kW				1.2/1.1/1.1 (0.59/0.55/0.55)	1420/1700/1720 (1410/1690/1720)	0.12
	0.4kW				2.3/2.0/2.0 (1.2/1.0/1.0)	1380/1650/1680 (1390/1670/1700)	0.16
	0.55kW				2.9/2.6/2.5 (1.45/1.3/1.3)	1380/1650/1690 (1380/1650/1690)	0.16

IE3 motor specifications (0.75 kW-5.5 kW)

Number of phases	Output	Number of poles	Frequency Hz	Voltage V	Rated current A	Rated revolution r/min	Energy efficiency %	Efficiency class IE code	AC-side brake current A Reference value at 20°C
Three-phase	0.75kW	4	50/60/60 (50/50/60/60)	200/200/220 (380/400/400/440)	4.0/3.5/3.4 (1.9/2.0/1.75/1.7)	1440/1730/1740 (1435/1440/1730/1740)	83.9/86.4/86.4 (83.6/83.9/86.4/86.4)	IE3	0.17
	1.5kW				6.6/6.0/5.8 (3.4/3.3/3.0/2.9)	1450/1745/1755 (1445/1450/1745/1755)	86.9/88.6/89.1 (86.7/86.9/88.6/89.1)		0.10
	2.2kW				9.6/8.8/8.4 (4.8/4.8/4.4/4.2)	1450/1745/1755 (1445/1450/1745/1755)	88.2/89.9/90.2 (88.1/88.2/89.9/90.2)		0.10
	3.7kW				15.4/14.4/13.6 (7.8/7.7/7.2/6.8)	1450/1745/1755 (1445/1450/1745/1755)	89.2/89.8/90.7 (88.6/89.2/89.8/90.7)		0.08
	5.5kW				22.6/20.8/20.0 (11.3/11.3/10.4/10.0)	1465/1760/1765 (1460/1465/1760/1765)	91.2/92.1/92.4 (91.2/91.2/92.1/92.4)		0.10

Note 1: The values in parentheses under "Rated current" and "Rated revolution" for 0.1 kW-0.4 kW are for 400/400/440 V.

Note 2: The values in parentheses under "Rated current" and "Rated revolution" for 0.75 kW-5.5 kW are for 380/400/400/440 V.

Note 3: For the brake-type models, the brake current shown above is added for the phase where the brake lead wire is connected to the motor lead wire. The AC-side brake current is for 200 V AC 60 Hz.

Note 4: The specifications for 0.75 kW-5.5 kW are the IE3 motor specifications for the Japanese market.

Please refer to other information to confirm that products comply with global voltage requirements.

Note 1: The actual reduction ratio is shown as the reduction ratio.

Note 2: The output shaft revolution rate is calculated by dividing the synchronous motor revolution rate by the reduction ratio.

Note 3: For output shaft arrangement "T" where torque is applied to both shafts, the sum of both torques should be equal to or less than the value shown in the table above.

Note 4: Values within parentheses for allowable output shaft O.H.L. are values for hollow shaft types.

Model number	Motor output kW	Actual reduction ratio	Number of reduction steps	Reducer frame number	Output shaft revolution r/min		Allowable output shaft torque				Allowable output shaft O.H.L.		Page and drawing number of outline dimensions

Note 1: The actual reduction ratio is shown as the reduction ratio.

Note 2: The output shaft revolution rate is calculated by dividing the synchronous motor revolution rate by the reduction ratio.

Note 3: For output shaft arrangement "T" where torque is applied to both shafts, the sum of both torques should be equal to or less than the value shown in the table above. Note 4: Values within parentheses for allowable output shaft O.H.L. are values for hollow shaft types.

Note 5: The models marked with ※ are ones for which torque is limited.

Specification Chart

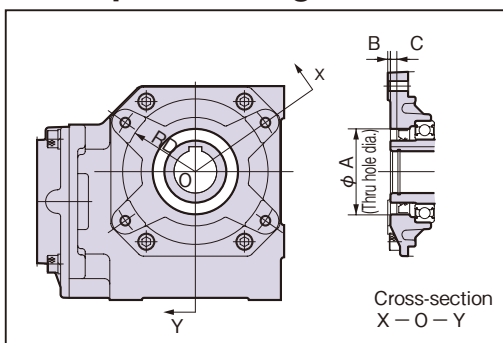

Output	Number of phases	Number of poles	Frequency Hz	Voltage V 50/60/60Hz	Rated current A 50/60/60Hz	Rated revolution r/min 50/60/60Hz	Protection	Cooling method	Rating	Insulation	Brake		
											Type	Rated torque of motor torque	Insulation
0.1kW	Three-phase	4	50/60/60	200/200/220 (400/400/440)	0.63/0.57/0.58 (0.32/0.29/0.29)	1420/1680/1710 (1440/1740/1740)	Totally enclosed (IP44)	Self managed (IC411)	Continuous	Class E	Non-excitation	At least 150%	Class B

Note 1: The values in parentheses under "Rated current" and "Rated revolution" are for 400 V class.
 Note 2: The protective construction for the brake type is IP20.

	180				8.3	10	59.8	{ 6.1 }	51.0	{ 5.2 }	2660	{ 271 }	
	200				7.5	9	60.3	{ 6.2 }	56.0	{ 5.7 }	2660	{ 271 }	
	240				6.3	7.5	76.0	{ 7.8 }	65.0	{ 6.6 }	3970	{ 405 }	
	300				5	6	92.0	{ 9.4 }	79.0	{ 8.0 }	3970	{ 405 }	

Note 1: The actual reduction ratio is shown as the reduction ratio. (They are all integer ratios.)
 Note 2: The output shaft revolution rate is calculated by dividing the synchronous motor revolution rate by the reduction ratio. Calculate the actual output revolution rate from the motor's rated revolution rate.
 Note 3: The models marked with * are ones for which torque is limited.

	240	1/240		6.3	7.5	484	{49.4}	414	{42.2}	12210	{ 1246}	6		
	300	1/300		5	6	587	{59.9}	501	{51.1}	12210	{ 1246}			

Note 1: The actual reduction ratio is shown as the reduction ratio.

Note 2: The output shaft revolution rate is calculated by dividing the synchronous motor revolution rate by the reduction ratio. Calculate the actual output revolution rate from the motor's rated revolution rate.

Note 3: For output shaft arrangement "T" where torque is applied to both shafts, the sum of both torques should be equal to or less than the value shown in the table above. In addition, the O.H.L. on one shaft should be equal to or less than 1/2 of the value shown in the table above.

Output Housing Dimensions

Frame number	Thru hole ϕA (H8)	B	C	RD
13	49	7.5	10	34
16	59.5	10	13	40.5
22	79	6.5	10	54
28	91	7	10	67
32	—	-5	0	66
40	—	-2	-1	86
50	—	-9	-4	107

Note: The ϕA dimension protrudes from the housing mounting surface by the length of dimension C. Be sure to have clearance of more than the length of C plus at least 1 mm between the mounting surface and the installation surface.

Specification Chart, Dimensions

Outline Dimensions

CSMA055-160U10 - 30 $\frac{1}{R}$ (B)

1

Reduction ratio : 10, 15, 20, 25, 30

Approx. weight : 11 (13) kg

CSMA055-220U40 - 60 $\frac{1}{R}$ (B)

2

Reduction ratio : 40, 50, 60

Approx. weight : 14 (16) kg

HCMA055-220U40 - 50 $\frac{1}{R}$ (B)

3

Reduction ratio : 40, 50

Approx. weight : 18.5 (20.5) kg

HCMA055-280U60 - 150 $\frac{1}{R}$ (B)

4

Reduction ratio : 60, 75, 90, 100, 120, 150

Approx. weight : 27.1 (29.1) kg

Note 1: The values in parentheses are for brake-equipped models.

Note 2: For output shaft arrangement "T", the right and left output shaft keyways are not aligned precisely.

Outline Dimensions

HCMA055-321U180 - 200 $\frac{L}{R}$ (B)

5

Reduction ratio : 180, 200

Approx. weight : 35.1 (37.1) kg

HCMA055-401U240 - 300 $\frac{L}{R}$ (B)

6

Reduction ratio : 240, 300

Approx. weight : 53.5 (55.5) kg

Note 1: The values in parentheses are for brake-equipped models.

Note 2: For output shaft arrangement "T", the right and left output shaft keyways are not aligned precisely.

Area with horizontal dotted lines for taking notes.

Specification Chart

Output	Number of phases	Number of poles	Frequency Hz	Voltage V 50/60/60Hz	Rated current A 50/60/60Hz	Rated revolution r/min 50/60/60Hz	Protection	Cooling method	Rating	Insulation	Brake

Note 1: The actual reduction ratio is shown as the reduction ratio. Note 2: The output shaft revolution rate is calculated by dividing the synchronous motor revolution rate by the reduction ratio. Calculate the actual output revolution rate from the motor's rated revolution rate.
 Note 3: For output shaft arrangement "T" where torque is applied to both shafts, the sum of both torques should be equal to or less than the value shown in the table above. In addition, the O.H.L. on one shaft should be equal to or less than 1/2 of the value shown in the table above.
 Note 4: The models marked with * are ones for which torque is limited.

Output Housing Dimensions

Frame number	Thru hole ϕA (H8)	B	C	RD
13	49	7.5	10	34
16	59.5	10	13	40.5
22	79	6.5	10	54
28	91	7	10	67
32	—	-5	0	66
40	—	-2	-1	86
50	—	-9	-4	107

Note: The ϕA dimension protrudes from the housing mounting surface by the length of dimension C. Be sure to have clearance of more than the length of C plus at least 1 mm between the mounting surface and the installation surface.

Specification Chart, Dimensions

Outline Dimensions

CSMR370-401U10 - 30^L/_R (B)

1

Reduction ratio : 10, 15, 20, 25, 30

Approx. weight : 74 (84) kg

CSMR370-501U40 - 60^L/_R (B)

2

Reduction ratio : 40, 50, 60

Approx. weight : 112 (122) kg

Note 1: The actual reduction ratio is shown as the reduction ratio.

Note 2: The output shaft revolution rate is calculated by dividing the synchronous motor revolution rate by the reduction ratio. Calculate the actual output revolution rate from the motor's rated revolution rate.

Note 3: For output shaft arrangement "T" where torque is applied to both shafts, the sum of both torques should be equal to or less than the value shown in the table above. In addition, the O.H.L. on one shaft should be equal to or less than 1/2 of the value shown in the table above.

Outline Dimensions

CSMA040-160L10 - 30 $\frac{L}{R}$ (B)

1

Reduction ratio : 10, 15, 20, 25, 30

Approx. weight : 7.5 (8.5) kg

CSMA040-220L40 - 60 $\frac{L}{R}$ (B)

2

Reduction ratio : 40, 50, 60

Approx. weight : 10 (11) kg

HCMA040-220L40 - 75 $\frac{L}{R}$ (B)

3

Reduction ratio : 40, 50, 60, 75

Approx. weight : 17 (19) kg

HCMA040-280L90 - 200 $\frac{L}{R}$ (B)

4

Reduction ratio : 90, 100, 120, 150, 180, 200

Approx. weight : 27 (29) kg

HCMA040-321L240 - 300 $\frac{L}{R}$ (B)

5

Reduction ratio : 240, 300

Approx. weight : 36 (38) kg

Note 1: The values in parentheses are for brake-equipped models.

Note 2: For output shaft arrangement "T", the right and left output shaft keyways are not aligned precisely.

Specification Chart

Note 1: The actual reduction ratio is shown as the reduction ratio.

Note 2: The output shaft revolution rate is calculated by dividing the synchronous motor revolution rate by the reduction ratio. Calculate the actual output revolution rate from the motor's rated revolution rate.

Note 3: For output shaft arrangement "T" where torque is applied to both shafts, the sum of both torques should be equal to or less than the value shown in the table above. In addition, the O.H.L. on one shaft should be equal to or less than 1/2 of the value shown in the table above.

Note 4: The models marked with * are ones for which torque is limited.

HYPOID MOTOR MINI Series

Features

Hypoid Motor Mini Series Features

Compact

Single-phase and
three-phase 40 W, 60 W,
and 90 W models

1 High torque

During revolution of a low output shaft at a high reduction ratio, there are no torque limitations so users get high torque transfer.

2 High efficiency

In order to reduce power consumption and generate high power output, all parts were meticulously designed with an eye to efficiency. Compared to the worm type, users get less sliding, greater efficiency, and lower operating costs.

3 Long life

The average service life of more than 10,000 hours is one of the highest in this product class.

4 Flexible mounting

With identical upper and lower pitches on the hypoid motor housing, they can be installed in a mirror configuration.

5 Wide range of reduction ratios

Choose from the following reduction ratios:

1/5, 1/8, 1/10, 1/15, 1/20, 1/25, 1/30, 1/40, 1/50, 1/60, 1/80, 1/100, 1/120, 1/160, 1/200, 1/240

6 Outdoor type equivalent to IP65 waterproof rating

All outdoor models have waterproof performance equivalent to IP65 under IEC standards.

Lead wire outlet type

Resin terminal box attached

Lead wire outlet foot mount type

Note 1: Outdoor models (W) have waterproof performance equivalent to IP65.
 Note 2: Outdoor models (W) with brake (B) are available.
 Note 3: Models equipped with resin terminal box (P) are not available with brake (B).
 Note 4: Contact us for single-phase, 90 W (HMMS90) outdoor models (W) and single-phase, 90 W (HMMS90) brake-equipped models (B).
 Note 5: The motors do not have micro surge protection.
 Note 6: Three-phase 400 V-class models cannot be inverter-driven.
 Note 7: Three-phase 200 V-class models can be inverter-driven, but they cannot be continuously operated in low frequencies or at 60 Hz and higher.
 Note 8: Refer to page 251 for voltages of global series products.

Specifications

Motor	Output	Three-phase: 40, 60, 90 W	Single-phase: 40, 60, 90 W
	Power supply	200/200/220 V 50/60/60 Hz	100 V 50/60 Hz
	Number of poles	4	4
	Protection	Totally enclosed type (IP30)	Totally enclosed type (90W is totally enclosed external fan type) (IP30)
	Cooling	Self-cooled type	Self-cooled type (90 W is self-managed type)
	Startup	—	Capacitor run
	Rating	S1 (continuous)	
	Insulation	120 (E)	
Brake	Non-excitation operation, DC electromagnetic brake (except single-phase 90 W)		
Reducer	Reduction ratio	1/5 to 1/240	
	Lubrication	Grease lubrication	
	Start end keyway	New JIS key (JISB1301-1976): output shaft key attached (except hollow shaft type; ordinary-class keyway)	
Ambient conditions	Output shaft end	With tap processing (except hollow shaft type)	
	Installation place	Indoor not exposed to dust or water	
	Temperature	-15°C to 40°C	
	Humidity	Less than 85% (non condensing)	
	Altitude	Elevations below 1000m	
	Atmosphere	Free from corrosive gases, explosive gases, and steam	
Mounting direction	No limitations on mounting angles: horizontal, vertical, or inclined		
Paint color	Munsell N7.5, light gray

Note 1: The actual reduction ratio is shown as the reduction ratio. (They are all integer ratios.)

Note 2: The output shaft revolution rate is calculated by dividing the synchronous motor revolution rate by the reduction ratio. Calculate the actual output revolution rate from the motor's rated revolution rate (page 193).

Note 3: For output shaft arrangement "T" where torque is applied to both shafts, the sum of both torques should be equal to or less than the value shown in the table above. In addition, the O.H.L. on one shaft should be equal to or less than 1/2 of the value shown in the table above.

Motor Specifications

Note 1: The actual reduction ratio is shown as the reduction ratio. (They are all integer ratios.)

Note 2: The output shaft revolution rate is calculated by dividing the synchronous motor revolution rate by the reduction ratio. Calculate the actual output revolution rate from the motor's rated revolution rate.

Note 3: For output shaft arrangement "T" where torque is applied to both shafts, the sum of both torques should be equal to or less than the value shown in the table above. In addition, the O.H.L. on one shaft should be equal to or less than 1/2 of the value shown in the table above.

1. Determination of reduction ratio

Determine the reduction ratio based on the necessary revolution speed of the output shaft. Select the reduction ratio by referring to the specification chart.

A: (1) Calculate the revolution speed (n_c) of the conveyor shaft.

$$n_c = \frac{V \times 1000}{D \times \pi} = \frac{14 \times 1000}{200 \times \pi} = 22.3 \text{ r/min}$$

(2) Calculate the revolution speed (n_L) of the hypoid motor output shaft.

$$n_L = n_c \times \frac{2}{1} = 44.6 \text{ r/min}$$

(3) Determine the reduction ratio.

According to the specification chart on page 54, an output shaft revolution speed of 45 r/min is closest to 60 Hz, 44.6 r/min. Therefore the suitable reduction ratio is 1/40.

B: (1) Calculate the revolution speed (n_c) of the conveyor shaft.

$$n_c = \frac{V \times 1000}{D \times \pi} = \frac{14 \times 1000}{200 \times \pi} = 22.3 \text{ r/min}$$

(2) Calculate the revolution speed (n_L) of the hypoid motor output shaft.

$$n_L = n_c = 22.3 \text{ r/min}$$

(3) Determine the reduction ratio.

According to the specification chart on page 54, an output shaft revolution speed of 22.5 r/min is closest to 60 Hz, 22.3 r/min. Therefore the suitable reduction ratio is 1/80.

2. Calculation of output shaft torque

Calculate the necessary output shaft torque based on the load torque.

To calculate the corrected torque of the output shaft, use Table 1 on page 206 to choose a service factor to multiply that matches the operating conditions.

A: (1) Calculate the necessary torque (T_c) of the conveyor shaft.

$$T_c = 9.8 \mu M \frac{D}{2} \times \frac{1}{1000} \times \frac{1}{\eta} = 9.8 \times 0.15 \times 150 \times \frac{200}{2000} \times \frac{1}{0.95} = 23.2 \text{ N}\cdot\text{m}$$

$$\left\{ T_c = \mu W \frac{D}{2} \times \frac{1}{1000} \times \frac{1}{\eta} = 0.15 \times 150 \times \frac{200}{2000} \times \frac{1}{0.95} = 2.37 \text{ kgf}\cdot\text{m} \right\}$$

(2) Calculate the hypoid motor output shaft torque (T_L) based on the conveyor shaft torque.

$$T_L = T_c \times \frac{1}{2} \times \frac{1}{\eta} = 23.2 \times \frac{1}{2} \times \frac{1}{0.95} = 12.2 \text{ N}\cdot\text{m}$$

$$\left\{ T_L = T_c \times \frac{1}{2} \times \frac{1}{\eta} = 2.37 \times \frac{1}{2} \times \frac{1}{0.95} = 1.25 \text{ kgf}\cdot\text{m} \right\}$$

- (3) Calculate the corrected torque (T_F) of the output shaft.

According to Table 1 on page 206, service factor $C_F = 1$, and $T_F = T_L \times 1 = 12.2 \text{ N}\cdot\text{m}$

$$\{T_F = T_L \times 1 = 1.25\text{kgf}\cdot\text{m}\}$$

- (4) Determine the motor capacity.

According to the specification charts on pages 54 to 56, the motor capacity suitable for "Reduction ratio: 1/40, 60 Hz, Torque: 12.2 N · m {1.25kgf · m}" is 0.1 kW.

- B:(1) Calculate the necessary torque (T_c) of the conveyor shaft.

$$T_c = 9.8\mu M \frac{D}{2} \times \frac{1}{1000} = 9.8 \times 0.15 \times 150 \times \frac{200}{2000} = 22.1 \text{ N}\cdot\text{m}$$

$$\left\{ T_c = \mu M \frac{D}{2} \times \frac{1}{1000} = 0.15 \times 150 \times \frac{200}{2000} = 2.25 \text{ kgf}\cdot\text{m} \right\}$$

- (2) Because the hypoid motor output shaft torque (T_L) is equal to the conveyor shaft torque, $T_L = T_c = 22.1 \text{ N}\cdot\text{m}$ ($T_L = T_c = 2.25 \text{ kgf}\cdot\text{m}$)

- (3) Calculate the corrected torque (T_F) of the output shaft.

According to Table 1 on page 206, service factor $C_F = 1$, and $T_F = T_L \times 1 = 22.1 \text{ N}\cdot\text{m}$ ($T_F = T_L \times 1 = 2.25 \text{ kgf}\cdot\text{m}$)

- (4) Determine the motor capacity.

According to the specification charts on pages 54 to 56, the motor capacity suitable for "Reduction ratio: 1/80, 60 Hz, Torque: 22.1 N · m {2.25kgf · m}" is 0.1 kW.

3. Tentative determination of model number

Keep in mind the reduction ratio, torque, and immediate stopping when performing the following.

Tentatively select A: brake-type hypoid motor HMTA010-22L40RB and confirm the conditions.

Tentatively select B: brake-type hypoid motor HMTA010-20H80B and confirm the conditions.

4. Confirmation of moment of inertia of load {load inertia (GD^2)} and starting frequency

When starting a motor with a large moment of inertia of the load (also when stopping, for brake-equipped models), a large torque is generated momentarily and this may cause an accident. Check the coupling method of the load and the moment of inertia [inertia load (GD^2)] of the load.

- A:(1) Calculate the moment of inertia of the load on the conveyor shaft (I_c) {Load inertia (GD_c^2)}.

$$I_c = MR^2 = 150 \times 0.1^2 = 1.5 \text{ kg}\cdot\text{m}^2 \quad R = \frac{1}{2}D$$

$$\{GD_c^2 = WD^2 = 150 \times 0.2^2 = 6 \text{ kgf}\cdot\text{m}^2\}$$

- (2) Calculate the moment of inertia (I_e) {load inertia (GD_e^2)} on the motor shaft.

$$I_e = I_c \times \frac{1}{i_c^2} \times \frac{1}{i_L^2} = 1.5 \times \left(\frac{1}{2}\right)^2 \times \left(\frac{1}{40}\right)^2 = 0.23 \times 10^{-3} \text{ kg}\cdot\text{m}^2$$

$$\left\{ GD_e^2 = GD_c^2 \times \frac{1}{i_c^2} \times \frac{1}{i_L^2} = 6 \times \left(\frac{1}{2}\right)^2 \times \left(\frac{1}{40}\right)^2 = 0.94 \times 10^{-3} \text{ kgf}\cdot\text{m}^2 \right\}$$

- (3) Calculate the inertia ratio (U) for the hypoid motor.

$$U = \frac{I_e}{I_M} \quad \left\{ U = \frac{GD_e^2}{GD_M^2} \right\}$$

According to page 218, the moment of inertia (I_M) {load inertia (GD_M^2)} on the motor shaft is $0.66 \times 10^{-3} \text{ kgf}\cdot\text{m}^2$ { $2.64 \times 10^{-3} \text{ kgf}\cdot\text{m}^2$ }, and

$$U = \frac{0.23 \times 10^{-3}}{0.66 \times 10^{-3}} \approx 0.35 \quad \left\{ U = \frac{0.94 \times 10^{-3}}{2.64 \times 10^{-3}} \approx 0.36 \right\}$$

- (4) Checking the starting frequency

According to Table 3 on page 206, the starting frequency is 30 times/hour, which satisfies the conditions.

- B:(1) Calculate the moment of inertia of the load on the conveyor shaft (I_c) {Load inertia (GD_c^2)}.

$$I_c = MR^2 = 150 \times 0.1^2 = 1.5 \text{ kg}\cdot\text{m}^2 \quad R = \frac{1}{2}D$$

$$\{GD_c^2 = WD^2 = 150 \times 0.2^2 = 6 \text{ kgf}\cdot\text{m}^2\}$$

- (2) Calculate the moment of inertia (I_e) (GD_e^2) on the motor shaft.

$$I_e = I_c \times \frac{1}{i_L^2} = 1.5 \times \left(\frac{1}{80}\right)^2 = 0.23 \times 10^{-3} \text{ kg}\cdot\text{m}^2$$

$$\left\{ GD_e^2 = GD_c^2 \times \frac{1}{i_L^2} = 6 \times \left(\frac{1}{80}\right)^2 = 0.94 \times 10^{-3} \text{ kgf}\cdot\text{m}^2 \right\}$$

(3) Calculate the inertia ratio (U) for the hypoid motor.

$$U = \frac{I_e}{I_M} \quad \left\{ U = \frac{GD_e^2}{GD_M^2} \right\}$$

According to page 218, the moment of inertia (I_M) on the motor shaft is $0.66 \times 10^{-3} \text{ kg} \cdot \text{m}^2$ ($2.64 \times 10^{-3} \text{ kgf} \cdot \text{m}^2$)

$$U = \frac{0.23 \times 10^{-3}}{0.66 \times 10^{-3}} \doteq 0.35 \quad \left\{ U = \frac{0.94 \times 10^{-3}}{2.64 \times 10^{-3}} \doteq 0.36 \right\}$$

(4) Checking the starting frequency

According to Table 3 on page 206, the starting frequency is 6 times/min., which satisfies the conditions.

Note: If the allowable starting frequency does not satisfy the conditions, the reducer may become damaged, and it will not last its expected life span. Choose a higher model number and recheck the starting frequency; or, lower the frequency of usage.

- If you cannot lower the frequency of usage, the product will have a shorter life span. Please contact Tsubaki.
- When the inertia ratio is large, we recommend a slow start using an inverter.

5. Confirmation of overhang load (O.H.L.)

When attaching a sprocket, gear, or belt to the output shaft or the input shaft, check that the overhang load acting on the shaft is equal to or less than the allowable overhang load of the hypoid motor (shown in the specification chart).

Calculate the O.H.L.

$$\text{O.H.L.} = \frac{2000T_F \times f \times L_f}{D_s}$$

A: Assuming that the load acts on the midpoint of the length of the shaft, use Table 4 and Formula 1 from page 206, and Table 5 on page 207, to make the following calculation to confirm that the calculated O.H.L. is within allowable O.H.L.

$$f = 1, L_f = 1$$

RS60-13T P.C.D = 79.6 mm and

$$\text{O.H.L.} = \frac{2000 \times 12.2 \times 1 \times 1}{79.6} = 307\text{N}$$

$$\left\{ \text{O.H.L.} = \frac{2000 \times 1.25 \times 1 \times 1}{79.6} = 31.4\text{kgf} \right\}$$

The allowable O.H.L. on the specification chart is 1617N [165 kgf], so the O.H.L. calculated above is within this range.

B: Assuming that the load acts on a position at ℓ from the hollow output shaft end, make the following calculation to confirm that the calculated O.H.L. is within allowable O.H.L.

$$f = 1, L_f = 1$$

$$\text{O.H.L.} = \frac{2000 \times 22.1 \times 1 \times 1}{200} = 221\text{N}$$

$$\left\{ \text{O.H.L.} = \frac{2000 \times 2.25 \times 1 \times 1}{200} = 22.5\text{kgf} \right\}$$

The allowable O.H.L. on the specification chart is 2254N [230 kgf], so the O.H.L. calculated above is within this range.

Note: If the calculated O.H.L. exceeds the allowable O.H.L., shift the load acting position toward the base of the output shaft, use a sprocket with longer P.C.D., or select a larger hypoid motor.

6. Determination of model number

The following model numbers have been selected as satisfying conditions for safe installation, power supply, immediate stopping, torque, reduction ratio, starting frequency, and O.H.L.

Brake-type hypoid motor **A: HMTA010-22L40RB**

B: HMTA010-20H80B

Technical Data to Use in Model Selection

1. Service factors

The values for output shaft capacity torque on the specification charts have been calculated based on a usage factor of 1.0. Keeping in mind the operating hours, operating conditions, and load conditions, select a service factor (C_F) from the table on the right to calculate the corrected output shaft torque.

Table 1. Service factors: (C_F)

Load condition	Operating hours	10 hours or less/day	10 hours or more/day
	Operating condition	Intermittent/continuous	Intermittent/continuous
Uniform load without shocks		1	1
Load with light shocks		1	1.2

Note: For loads with medium or large shocks, please contact Tsubaki.

2. Inertia ratio and allowable starting frequency

During start-up, impact torque occurs due to load inertia (also during stopping, for brake-equipped models), and an accident may occur due to the coupling method of the load and the load inertia size. Confirm using the following procedure according to the coupling method of the load and the load inertia.

- Calculate moment of inertia (I) of load {load inertia (GD²)}
- Calculate moment of inertia (I_L) of load for motor shaft conversion {load inertia (GD_L²)}
- Calculate the inertia ratio (U) of the compact gear motor.

$$U = \frac{I_L}{I_M} \quad \left\{ U = \frac{GD_L^2}{GD_M^2} \right\}$$

I_n{GD_M²}: Moment of inertia of the motor shaft of the gear motor {Motor shaft-equivalent inertia}

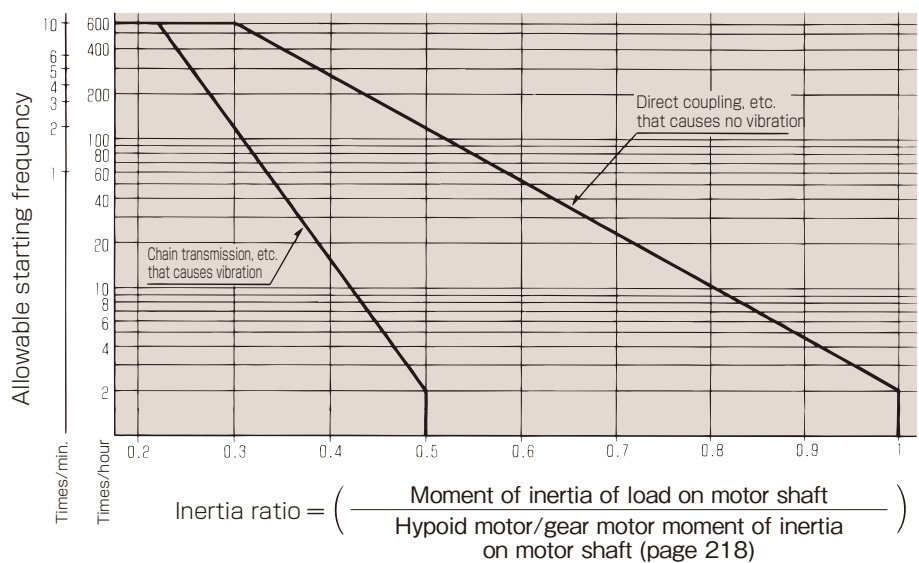

- Confirm that the allowable starting frequency is satisfied by referring to Tables 1 and 2.

Table 2. Croise motor inertia ratio and allowable starting frequency

Load characteristics	Inertia ratio: U	Allowable starting frequency
Without backlash	1	4 times/hr.
	0.5	4 times/min.
	0.2 or less	10 times/min.
With backlash, such as a chain	0.5	4 times/hr.
	0.3	4 times/min.
	0.2 or less	10 times/min.

Note: For conditions other than in Table 2 above, please contact Tsubaki.

Table 3. GEAR MOTOR, HYPOID MOTOR: Inertia ratio and allowable starting frequency

3. Overhang load of the output shaft

When attaching the sprocket, gear, or belt to the output center shaft, or to the hollow shaft using a case tap, confirm that the overhang load acting on the output shaft is equal to or lower than the allowable O.H.L. of the gear motor.

Note: When using a high-strength toothed belt, do not use the O.H.L. factor shown in Table 3, but take into account the mounting tension in calculating the O.H.L.

Overhang load calculation

$$\text{Allowable O.H.L.} \geq \frac{2000 \times T_F \times f \times L_f}{D_p}$$

T_F : Corrected torque

f : OHL factor (Table 1)

L_f : Load acting position factor (Formula 1)

D_p : Pitch circle diameter of sprocket (mm)

Table 4. O.H.L. factor f

Chain	Toothed gear belt	V belt

Formula for Brake Life Span and Braking Distance

1. Braking workload

$$E_e = \frac{(I_M + I_e) \times n^2}{182.5} \times \frac{T_b}{(T_b \pm T_e)} \left\{ E_e = \frac{(GD_M^2 + GD_e^2) \times n^2}{7160} \times \frac{T_b}{(T_b \pm T_e)} \right\}$$

E_e : Braking workload per operation J {kgf·m}

I_M { GD_M^2 } : Moment of inertia of brake-type hypoid motor (gear motor) $kg \cdot m^2$ (Page 218)

I_e { GD_e^2 } : Moment of inertia of motor shaft-equivalent load $kg \cdot m^2$ { $GD^2 \cdot fm^2$ }

n : Motor shaft revolution r/min {kgf·m}

T_b : Dynamic friction torque of brake N·m {kgf·m} (Brake specifications on pages 217 and 218)

T_e : Motor shaft-equivalent load torque N·m {kgf·m}

\pm sign : ($- T_e$) is applied for a negative load such as a suspension load.

2. Brake life span

$$Z = \frac{E_T}{E_e} \quad \begin{array}{l} Z : \text{Total number of working cycles} \\ E_T : \text{Total braking workload J \{kgf \cdot m\}} \end{array}$$

(Brake specifications on pages 217 and 218)

3. Braking time

$$t = t_a + t_b$$

$$t_b = \frac{(I_M + I_e) \times n}{9.55 \times (T_b \pm T_e)} \left\{ t_b = \frac{(GD_M^2 + GD_e^2) \times n}{375 \times (T_b \pm T_e)} \right\}$$

t_a : Braking delay time s

Time between operation signal issuing and brake operation

(Refer to brake specifications on pages 217 and 218.)

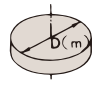

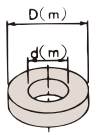

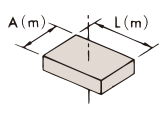

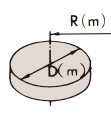

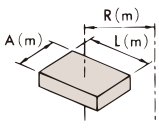

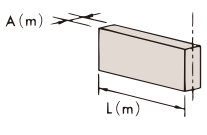

4. Braking distance

$$S = \left(t_a + \frac{1}{2} t_b \right) \times V$$

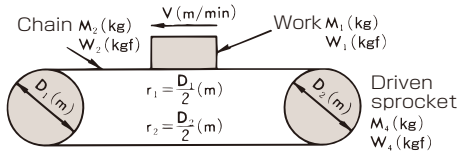

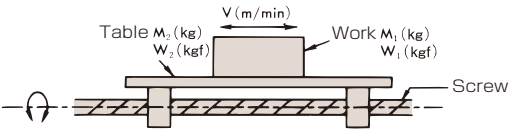

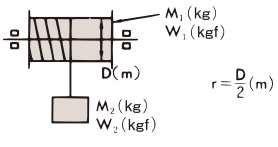

S: Braking distance mm
V: Speed of linear motion mm/s

How to Calculate Moment of Inertia

1. Moment of inertia of rotational body

	Moving body	Moment of inertia formula SI units	GD ² formula {Gravitational units}
When center of rotation is the same as shaft	 <p>$r = \frac{D}{2} (m)$ M(kg) W(kgf)</p>	$I = \frac{1}{2} Mr^2$ <p>(kg · m²)</p>	$GD^2 = \frac{1}{2} WD^2$ <p>{kgf · m²}</p>
	 <p>$r_1 = \frac{D}{2} (m)$ $r_2 = \frac{d}{2} (m)$ M(kg) W(kgf)</p>	$I = \frac{1}{2} M (r_1^2 + r_2^2)$ <p>(kg · m²)</p>	$GD^2 = \frac{1}{2} W (D^2 + d^2)$ <p>{kgf · m²}</p>
	 <p>A(m) L(m) M(kg) W(kgf)</p>	$I = \frac{1}{12} M (A^2 + L^2)$ <p>(kg · m²)</p>	$GD^2 = \frac{1}{3} W (A^2 + L^2)$ <p>{kgf · m²}</p>
When center of rotation is different from shaft	 <p>R(m) $r = \frac{D}{2} (m)$ M(kg) W(kgf)</p>	$I = M \left(\frac{r^2}{2} + R^2 \right)$ <p>(kg · m²)</p>	$GD^2 = W \left(\frac{1}{2} D^2 + 4R^2 \right)$ <p>{kgf · m²}</p>
	 <p>A(m) L(m) R(m) M(kg) W(kgf)</p>	$I = \frac{M}{4} \left(\frac{A^2 + L^2}{3} + 4R^2 \right)$ <p>(kg · m²)</p>	$GD^2 = W \left(\frac{A^2 + L^2}{3} + 4R^2 \right)$ <p>{kgf · m²}</p>
	 <p>A(m) L(m) M(kg) W(kgf)</p>	$I = \frac{M}{12} (A^2 + 4L^2)$ <p>(kg · m²)</p>	$GD^2 = \frac{1}{3} W (A^2 + 4L^2)$ <p>{kgf · m²}</p>

2. Moment of inertia of parallel moving body

 <p>Chain $M_2 (kg)$ $W_2 (kgf)$ $V (m/min)$ Work $M_1 (kg)$ $W_1 (kgf)$ Drive sprocket $M_3 (kg)$ $W_3 (kgf)$ $D_1 (m)$ $r_1 = \frac{D_1}{2} (m)$ $r_2 = \frac{D_2}{2} (m)$ Driven sprocket $M_4 (kg)$ $W_4 (kgf)$ $D_2 (m)$</p>	$I = M_1 r_1^2 + M_2 r_1^2 + \frac{M_3 r_1^2 + M_4 r_2^2}{2}$ <p>(kg · m²)</p>	$GD^2 = W_1 D_1^2 + W_2 D_1^2 + \frac{W_3 D_1^2 + W_4 D_2^2}{2}$ <p>{kgf · m²}</p>
 <p>Table $M_2 (kg)$ $W_2 (kgf)$ $V (m/min)$ Work $M_1 (kg)$ $W_1 (kgf)$ Screw</p>	$I = \frac{1}{4} (M_1 + M_2) \times \left(\frac{V}{\pi n} \right)^2$ <p>(kg · m²)</p> <p>n : Motor revolution speed to V (r/min)</p>	$GD^2 = (W_1 + W_2) \times \left(\frac{V}{\pi n} \right)^2$ <p>{kgf · m²}</p> <p>n : Motor revolution count to V (r/min)</p>
 <p>$M_1 (kg)$ $W_1 (kgf)$ $D (m)$ $r = \frac{D}{2} (m)$ $M_2 (kg)$ $W_2 (kgf)$</p>	$I = \frac{1}{2} M_1 r^2 + M_2 r^2$ <p>(kg · m²)</p>	$GD^2 = \frac{1}{2} W_1 D^2 + W_2 D^2$ <p>{kgf · m²}</p>

Hypoid Motor Mini

■ Brake-Equipped Motor Connection

1. 0.1 kW to 5.5 kW, 200 V class: Gear Motors, Hypoid Motors, Croise Motors

- Standard products are shipped with AC internal wiring.
- Response time will differ depending on the connections. Refer to the following diagram and select the wiring suitable to the application.

Application		Gear motor Hypoid motor Croise motor		
		Three-phase 200 V 0.1 kW to 0.55 kW	Three-phase 200 V 0.75 kW to 3.7 kW	Three-phase 200 V 5.5 kW
AC internal wiring	<ul style="list-style-type: none"> • Normal use • Standard shipping specifications 			
AC external wiring	<ul style="list-style-type: none"> • To shorten the stop time • When attaching a phase advancing condenser 			
AC external operation	<ul style="list-style-type: none"> • For use with an inverter (Set the inverter to the MC section.) • When operating the brake separately 	<p>Supply voltage to the brake at the point marked with ※3 should be 200 V to 254 V AC for 0.1 kW and 0.2 kW, 200 V to 220 V AC for 0.4 kW and 0.55 kW.</p>	<p>Supply voltage to the brake at the point marked with ※3 should be 200 V to 220 V AC for 0.75 kW and 3.7 kW, and 200 V to 230 V AC for 1.5 kW to 2.2 kW.</p>	
DC external wiring	<ul style="list-style-type: none"> • When stopping accuracy is required (for lift, etc.) 			

Ⓜ: Motor Ⓟ: Brake MC: Electromagnetic contactor MCa: Auxiliary relay OCR: Overcurrent relay DM200D, PM180B: DC module -N: Protective element (varistor)

Note 1: Brake voltage is 90 V DC (when 200 V AC is input to DM200D and PM180B).

Note 2: When DC external wiring is used, the power supply module for the brake may be damaged due to the wire length, wiring method, relay type, or other factors. Therefore, connect a varistor between the terminals for DC external wiring.

For maximum effectiveness, connect the varistor near the power supply module for the brake (the blue lead wire sections). Refer to the varistor models below. Select a 470 V varistor voltage for the DM200D.

Product name	Manufacturer name	Model number
		For DM200D
Surge Absorber	Panasonic Corporation	ERZV14D471
Z-trap	Fuji Electric Device Technology Co., Ltd.	ENE471D-14A
Ceramic Varistor	Nippon Chemi-Con Corporation	TND14V-471KB00AAA0

Note 3: For the auxiliary relay (MCa) in ※ 1 (in the above diagram), use one with a contact capacity of 200 V AC, 7 A (resistance load) or higher. When an MC auxiliary contact point or auxiliary relay is used for ※ 2 (in the above diagram), use a contact capacity of 200 V AC, 10 A (resistance load) or higher.

2. 0.1 kW to 5.5 kW, 400 V class: Gear Motors, Hypoid Motors, Croise Motors

- Standard products are shipped with AC internal wiring. (Contact Tsubaki regarding the 5.5 kW model.)
- Response time will differ depending on the connections. Refer to the following diagram and select the wiring suitable to the application.

Application	Gear motor Hypoid motor Croise motor		
	Three-phase 400 V 0.1 kW to 0.55 kW	Three-phase 400 V 0.75 kW to 3.7 kW	Three-phase 400 V 5.5 kW
AC internal wiring <ul style="list-style-type: none"> • Normal use • Standard shipping specifications 			
AC external wiring <ul style="list-style-type: none"> • To shorten the stop time • When attaching a phase advancing condenser 			
AC external operation <ul style="list-style-type: none"> • For use with an inverter Set the inverter to the MC section. • When operating the brake separately 	<p>Note: Disconnect the brown N section from the terminal block with a closed-end connector. Then be sure to insulate the N section. When inputting power to the DC module using a transformer, the transformer should have 60 VA (0.1 kW to 0.4 kW). Supply voltage to the brake at the point marked with ※1 should be 200 V to 254 V AC for 0.1 kW and 0.2 kW, and 230 V to 254 V AC for 0.4 kW and 0.55 kW.</p>	<p>※1 380 V to 440 V AC for 0.75 kW and 3.7 kW. 380 V to 460 V AC for 1.5 kW and 2.2 kW.</p>	
DC external wiring <ul style="list-style-type: none"> • When stopping accuracy is required (for lift, etc.) 			

Ⓜ: Motor Ⓟ: Brake MC: Electromagnetic contactor MCa: Auxiliary relay OCR: Overcurrent relay DM200D, DM400D, HD-120MH1: DC module -N-: Protective element (varistor)

Note 1: Brake voltage is 90 V DC (when 200 V AC is input to DM200D).

Note 2: When DC external wiring is used, the power supply module for the brake may be damaged due to the wire length, wiring method, relay type, or other factors. Therefore, connect a varistor between the terminals for DC external wiring.

For maximum effectiveness, connect the varistor near the power supply module for the brake (the blue lead wire sections). Refer to the varistor models below. Select a 470 V varistor voltage for the DM200D.

Note 3: The HD-120MH1 DC module for 3.7 kW and 5.5 kW models is shipped separately. Wiring for this must be done by the customer. For dimensions, see page 217.

Note 4: The DM400D has a built-in varistor, so an external varistor is not necessary.

For the auxiliary relay (MCa) in ※4 (in the above diagram), use one with a contact voltage of 400–440 V AC and an inductive load of 1 A or higher. For the auxiliary relay (MCa) in ※5 (in the above diagram), connect in a series of two or three relays with a contact voltage of 400–440 V AC and an inductive load of 1 A or higher.

Product name	Manufacturer name	Model number
		For DM200D
Surge Absorber	Panasonic Corporation	ERZV14D471
Z-trap	Fuji Electric Device Technology Co., Ltd.	ENE471D-14A
Ceramic Varistor	Nippon Chemi-Con Corporation	TND14V-471KB00AAA0

Note 5: For the auxiliary relay (MCa) in ※1 (in the above diagram), use one with a contact point capacity of 200 V AC, 7 A (resistance load) or higher. When an MC auxiliary contact point or auxiliary relay is used for ※2 (in the above diagram), use one with a contact capacity of 200 V AC, 10 A (resistance load) or higher.

3. 40 W, 60 W, 90 W: Hypoid Motor Mini Series

- Standard products are shipped with AC internal wiring.
- Response time will differ depending on the connections. Refer to the following diagram and select the wiring suitable to the application.

Application	3-phase motor, standard voltage (200 V class)	3-phase motor, double voltage (400 V class)	Single-phase motor 100 V (200 V)
<ul style="list-style-type: none"> ◦ Normal use ◦ Standard shipping specifications 			
<ul style="list-style-type: none"> ◦ To shorten the stop time ◦ When attaching a phase advancing condenser 			
<ul style="list-style-type: none"> ◦ When operating the brake separately <p>Note: For the auxiliary relay (MCa), use one with a nominal load of 200 V AC, 7 A or higher.</p>	<p>200-220 V AC</p>	<p>200-220 V AC</p> <p>Note: Disconnect the N section with a closed-end connector. Then be sure to insulate the N section. When supplying 200 V voltage to the DC module using a transformer, the transformer should have a capacity of 60 VA or more.</p>	<p>100-110 V AC (200-220 V AC)</p>
<ul style="list-style-type: none"> ◦ When a lift and stopping accuracy are required <p>Note: Contact capacity for the point marked with * should be 200 V AC, 10 A or higher.</p>			

Ⓜ : Motor Ⓟ : Brake MC: Electromagnetic contactor MCa: Auxiliary relay OCR: Overcurrent relay C: Capacitor (accessory)
 DM200D, DM100A: DC module, - N - : Protective element (varistor)

Note 1: After connecting and before turning on the power, confirm that the DC module's lead wires are placed as follows: the yellow wire is on the power supply side and the black wire is on the brake side.

Note 2: The DC module has a built-in diode. An erroneous connection will cause a short circuit that will damage the DC module.

Note 3: Add a protective element for protecting contact points as necessary.

Note 4: When using an inverter, do not use it in a circuit other than that for AC external operation.

Note 5: When DC external wiring is used, the power supply module for the brake may be damaged due to the wire length, wiring method, relay type, or other factors. Therefore, connect a varistor between the terminals for DC external wiring.

For maximum effectiveness, connect the varistor near the power supply module for the brake (the blue lead wire sections). Refer to the varistor models below. Select a 470 V varistor voltage for the DM200D.

Product name	Manufacturer name	Model number
		For DM100A and DM200D
Surge Absorber	Panasonic Corporation	ERZV14D471
Z-trap	Fuji Electric Device Technology Co., Ltd.	ENE471D-14A
Ceramic Varistor	Nippon Chemi-Con Corporation	TND14V-471KB00AAAO

Note 6: Capacitor for single-phase motor operation

40 W: 15 μ F, 60 W: 18 μ F, 90 W: 27 μ F (All have a resistance voltage of 220 V.)

Note 7: For the DM100A, the color differs from the diagram above. (Yellow \rightarrow Red, Blue \rightarrow None)

Heat generation from the motor

During motor operation, all the motor's internal loss turns into heat, which the motor generates. In particular, a single-phase capacitor-run motor will get very hot if the load rate is low. Depending on conditions, the motor's outer casing may exceed temperatures of 90° C during operation. This is not unusual. Be careful not to accidentally touch the motor, and avoid accidents by keeping flammable objects away from it.

■ When a Standard Motor Is Continuously Inverter-Driven

1. Frequency range

- Maximum 120 Hz. In the low-Hz range (low frequency), use within the allowable range of the inverter.
- 40/60/90 W models cannot be used in the low-frequency range and at continuous operation of 60 Hz or higher. Please contact Tsubaki.
- The 0.75 kW to 5.5 kW IE3 motors can be operated at constant torque between 6 Hz to 60 Hz. See page 233 for details.

2. Torque characteristics

For the frequency and torque characteristics, refer to the following graphs.

- At high frequencies, the torque decreases in reverse proportion to the revolution because of the constant kW. The motor noise, motor fan noise, reducer noise, and vibration increase because the revolution speed is high.
- At low frequencies, the temperature increases largely because the operating efficiency and cooling efficiency of the motor decrease. Use with a lower torque as shown below.

3. Brake type

- Because the brake requires a fixed power supply (frequency, voltage), set up the brake circuit separately. For the standard product, the brake lead wire and motor lead wire are shipped screwed together. Therefore, remove the screw and connect each lead wire separately.
- Perform braking at 60 Hz (1800 r/min) or less speed.
Braking at high frequencies, above 60 Hz, may cause mechanical damage or excessive wear on the lining of the brake. Be sure to operate at 60 Hz or lower.

4. For single-phase motors and explosion-proof motors

Because the single-phase motor uses a capacitor, inverter drive is not available. Inverter drive is also not available for the explosion-proof motor because it is not covered by the applicable power supply (frequency, voltage) for explosion-proof testing.

5. Precautions

When using a motor with a low frequency or with a frequency of 60 Hz or higher, lower the torque as shown in the graphs above.

- When using inverter drive with a 400 V-class motor, dielectric breakdown may occur due to a high-voltage surge (micro surge) that occurs with switching of the inverter. Countermeasures are therefore needed for the motor (micro surge protection). Standard 400 V-class-and-higher motors come standard with micro surge protection. However, for 1,250 V and higher, install a suppression filter or a reactor on the inverter side.
- Increased temperatures, noise, and vibration result when compared with using a commercial power supply.
- To protect the motor from overheating, use an electronic thermal relay set to general-use motor specifications, or install a thermal relay between the inverter and the motor.
- When using the motor in the base frequency of 50 Hz, apply an output torque in the above table multiplied by 0.8. (For 0.1 kW to 0.4 kW models only.)

Inverter motor type

For 0.1 kW to 0.4 kW models, the inverter motor type is available as an option. For details, see page 232.

Rectifiers (DC Modules)

The built-in DC module is connected with the motor lead wire. When employing a DC external wiring circuit, follow the connecting diagrams on pages 206-208. If instructed by the customer at time of order, we will connect the DC external wiring before we ship the product to the customer. When separate delivery of the DC module is necessary, such as when the DM200D will be used in the control panel, etc., the items in the following illustration will be delivered if the customer requests this at time of order.

■ Moment of Inertia of Motor Shaft

1. Gear Motor and Hypoid Motor TA/TR Series (· SI units: Moment of inertia · Gravitational units: GD²)

Note 1: The above figures are calculated values.

Note 2: Common to foot mount, face mount, and hollow shaft types.

Note 3: However, values within parentheses in (shaded sections) of the table are values for hollow shaft models.

About Self-Lock

In the static condition, the input shaft (motor shaft) of a worm reducer (Croise motor) will not start to rotate even if the output shaft of the reducer is caused to rotate. This effect is called "self lock." In addition, although the input shaft (motor shaft) will rotate, a large force would have to be applied on the output shaft to make this happen. This effect is called the "self-locking effect" or "braking effect." This self-locking effect depends on the lead angle of the worm gear, the condition of the tooth surfaces, and the lubricating oil.

In our standard specification worm reducer (Croise motor), the self-locking effect can be expected in the static condition when the reduction ratio of the worm gear is 1/50 or 1/60. The self-locking effect and the braking effect can also be anticipated at other reduction ratios (1/10 to 1/40).

However, the self-locking effect may be diminished if the reducer is subject to shock or external vibrations. When reliable reverse rotation ("back driving") prevention is required, a brake option is recommended.

Also, in applications where the load inertia is very large (such as transport devices or circulating movement equipment), sudden braking may occur due to the self-lock or self-locking effect, which is extremely dangerous. For such applications, select a lower worm gear reduction ratio of 1/10 to 1/20.

Internal Structure

1. Gear Motor TA Series, TR Series

Two-step reduction

- ① Motor
- ② L case
- ③ M bracket
- ④ 1st stage wheel
- ⑤ 2nd shaft pinion
- ⑥ Output shaft wheel
- ⑦ Metal (2nd shaft M bracket side)
- ⑧ Metal (2nd shaft L case side)
- ⑨ Metal (output shaft M bracket side)
- ⑩ Bearing (output shaft L case side)
- ⑪ Bearing (motor shaft load side)
- ⑫ Oil seal (output side)
- ⑬ Oil seal (motor shaft)
- ⑭ O-ring
- ⑮ Filter
- ⑯ Shim

Three-step reduction

- ① Motor
- ② L case
- ③ M bracket
- ④ 1st stage wheel
- ⑤ 2nd shaft pinion
- ⑥ 2nd stage wheel
- ⑦ 3rd shaft pinion
- ⑧ 3rd stage wheel
- ⑨ Output shaft

- 19 Parallel key square
- 20 Parallel key square
- 21 Parallel key square
- 22 Pressure vent
- 23 Oil gauge
- 24 Wave washer
- 25 Shim
- 26 Motor
- 27 Filter

Note: The above structural drawings are representative drawings. Specification details will vary from model to model. Please contact Tsubaki.

4. Hypoid Motor Mini Series

Note: The above structural drawings are representative drawings. Specification details will vary from model to model. Please contact Tsubaki.

Brake Structure

1. Three-phase 0.1 kW to 2.2 kW: Gear Motors, Hypoid Motors, Croise Motors

The optional one-touch manual release is also available. Refer to page 235 for details.

SLB brake

Gear motor, hypoid motor
Three-phase 0.1 kW

Gear motor, hypoid motor
Three-phase 0.2 kW to 0.4 kW
Croise motor
Three-phase 0.1 kW to 0.4 kW

Gear motor, hypoid motor, croise motor
Three-phase 0.75 kW to 2.2 kW

1. Anti-load bracket with yoke
2. Coil
3. Armature
4. Presser bar spring
5. Brake plate
6. U nut
7. Collar
8. Guide bolt
9. Lining
10. Fan cover
11. Fan
(not provided in the left figure)
12. Square hub
13. Snap ring
14. Key
15. Spring pin
16. Brake spring
17. Fan cover set screw
18. DC module
19. Closed-end connector

Manual release (standard equipment)

- Perform release with no load applied to the output shaft.
- Remove the fan cover and install the screws.
- After the completion of work, be sure to remove the screws and install the cover before starting operation.

Note: M6 screw for 1.5 kW and 2.2 kW models.

2. Three-phase 3.7 kW to 5.5 kW: Hypoid Motors, Croise Motors

VNB brake

1. Yoke
2. Coil
3. Brake spring
4. Armature
5. Lining
6. Anti-load bracket
7. Stud bolt
8. Liner
9. Distance collar
10. Protective liner
11. Hexagon nut
12. Brake plate
13. Sheet packing
14. Center hub
15. Silencer
16. O-ring
17. Fan
18. Fan cover
19. Snap ring
20. Key
21. DC module
22. Closed-end connector

3. Three-phase 40 W to 90 W, single-phase 40 W to 60 W: Hypoid Motor Mini Series

- 1. Coil
- 2. Stator
- 3. Armature
- 4. Rotor (lining)
- 5. Rotor hub
- 6. Mounting flange
- 7. Stud bolt
- 8. Torque spring
- 9. Auxiliary spring
- 10. Silencer spring
- 11. Lead wire (with protective tube)
- 12. Key
- 13. Set screw
- 14. Hexagon U nut
- 15. Brake cover
- 16. DC module

■ Gear Motors

Flange

When converting a face mount type to a flange mount type, use an S flange or an M flange. (Material: cast iron)

1. S flange (eccentric)

Flange number

Reduction ratio	Motor output			
	0.1 kW	0.2 kW	0.4 kW	0.75 kW
5	UFS27 (UFS25)		UFS27 (UFS25)	UFS37
10, 15, 20, 25	UFS15 (UFS13)	UFS15 (UFS13)	UFS27 (UFS25)	
30, 40, 50	UFS27 (UFS25)	UFS27 (UFS25)	UFS37	
60, 75	UFS27 (UFS25)	UFS27 (UFS25)	UFS37	
100, 120, 165, 200	UFS27 (UFS25)	UFS37		

Note: Shown in parentheses is the one-frame smaller S flange.

Dimensions

Unit: mm

Flange number	Cs	E	F	H	R	O	Y	Z	Mass kg
UFS13	18	4	12	135	32	125	150	9	1.2
UFS15	20	4	12	150	32	140	170	9	1.3
UFS25	20	4	16	150	41(32)	140	170	9	1.4
UFS27	24	4	16	175	41(32)	165	200	11	2.3
UFS37	24	4	18	175	47	165	200	11	2.1

Note: The dimensions in parentheses are applied when installing the 0.1 kW and 0.2 kW devices with a reduction ratio of 1/5.

2. M flange (concentric)

Flange number

Reduction ratio	Motor output				
	0.1kW	0.2kW	0.4kW	0.75kW	1.5kW
5	UFM26		UFM26	UFM39	UFM48
10, 15, 20, 25	UFM15	UFM15	UFM26	UFM39	
30		UFM15	UFM26	UFM39	UFM48
40, 50	UFM26	UFM26	UFM39	UFM48	
60, 75		UFM26	UFM39	UFM48	
100, 120, 165, 200	UFM26	UFM39	UFM48		

Dimensions

Unit: mm

Flange number	E	F	H	R	O	Y	Z	Mass kg
UFM15	3.5	12	155	32	145	170	M10	1.4
UFM26	3.5	16	165	41(32)	148	185	M12	1.7
UFM39	4	18	190	47	180	215	M12	2.5
UFM48	5	26.5	280	60.5	260	290	φ 12	7.5

Note 1: For the UFM48 only, the bolthole used for fixing the flange is a through-hole.

Note 2: The dimensions in parentheses are applied when installing the 0.1 kW, 0.2 kW, 100 W, and 200 W devices with a reduction ratio of 1/5.

Hypoid Motors

1. Shaft end cover

For the hollow shaft type, a cover for the shaft end opposite the mounting end is provided.

It is compatible with the adapter type and the inline reducer type. (Material: polypropylene resin; color: green)

Model number: HM140CAP

Model number	Applicable model
HM70CAP*	HMTA010-20H5~120
	HMTA020-20H5~60
HM90CAP*	HMTA010-30H160~35H1200
	HMTA020-30H80~45H1200
	HMTA040-30H5~45H480
	HMTR075-35H5~45H200
	HMTR150-45H5~80
HM140CAP	HMTR220-45H5~60
	HMTA040-55H600~1200
	HMTR075-55H300~480
	HMTR150-55H100~200
	HMTR220-55H80~120
HMTR370-55H5~60	
HMTR550-55H5~40	

* Paint color CO (light gray) for HM70CAP and HM90CAP is also available.

2. Torque arm

For the hollow shaft type, a torque arm used for on-shaft mounting is provided.

It is compatible with the adapter type and the inline reducer type. (Material: SS400)

Model number: HM150TA

Mounting example

The torque arm can be attached to either the short pitch or the long pitch side according to the mounting condition of the reducer.

Unit: mm

Mini Series

1. Shaft end cover

For the hollow shaft type, attach the cover to the shaft end opposite the mounting end.

2. Torque arm

Used for on-shaft mounting on the hollow shaft type.

Technical Information
Options

■ Supporting Voltage

1. 400 V class: Double voltage (option code: V)

(1) Supporting capacities: 0.1 kW to 0.55 kW

Motor that supports different voltages of three ratings in 400 V class: 400 V/50 Hz, 400 V/60 Hz, 440 V/60 Hz

(2) Supporting capacities: 0.75 kW to 5.5 kW

Motor that supports different voltages of four ratings in 400 V class: 380 V/50 Hz, 400 V/50 Hz, 400 V/60 Hz, 440 V/60 Hz

2. 400 V class: Different voltage (option code: V1, V2, V3, V4)

○ Optional product

Series	400 V class different voltage	Option code	Motor capacity								
			0.1 kW	0.2 kW	0.4 kW	0.55 kW	0.75 kW	1.5 kW	2.2 kW	3.7 kW	5.5 kW
Gear motor	380 V/50 Hz	V1	○	○	○	–	◎	◎	◎	◎	◎
	380 V/60 Hz	V2	○	○	○	–	○	○	–	–	–
Hypoid motor	415 V/50 Hz	V3	○	○	○	–	○	○	○	○	○
	460 V/60 Hz	V4	○	○	○	–	○	○	○	○	○

Note: ◎ symbol indicates support for option code V (double voltage).

3. 200 V class: Different voltage

Motor that supports voltages in the 200 V class other than the three ratings shown above.

(There are no option codes.)

○ Optional product

Series	200 V class different voltage		Motor capacity								
			0.1 kW	0.2 kW	0.4 kW	0.55 kW	0.75 kW	1.5 kW	2.2 kW	3.7 kW	5.5 kW
Gear motor	210 V	50 Hz	○	○	–	–	–	–	–	–	–
		60 Hz	○	○	○	–	–	–	–	–	–
Hypoid motor	220 V	50 Hz	○	○	○	–	–	–	–	–	–
		60 Hz	–	–	–	–	–	△	△	△	△
Croise motor	230V	50 Hz	○	○	○	–	–	–	–	–	–
		60 Hz	○	○	○	–	–	△	△	△	△
	240 V	60 Hz	–	–	–	–	–	△	–	△	△

Note: △ symbol indicates made-to-order products.

Inverter Motor Type (Option Code: Z, ZV)

Motors used exclusively for inverters and can be run in constant torque in the range of 6 Hz to 60 Hz during inverter driving.

Supporting capacities: 0.1 kW to 0.4 kW, standard motor

Series	Voltage	Code	Motor capacity		
			0.1 kW	0.2 kW	0.4 kW
Gear motor	200 V class	Z	○	○	○
Hypoid motor	400 V class	ZV	○	○	○
Croise motor			○	○	○

Note: Rated voltage (0.1 kW-0.4 kW, 200 V class: 200/220 V, 60 Hz; 400 V class: 400/440 V, 60 Hz)

○ Optional products

Precautions

- At frequencies of 60 Hz to 120 Hz, as with the standard motor, there is a characteristic zone with constant horsepower and limited output torque. Care should therefore be taken with the load torque.
- Be sure to adjust the output voltage of the inverter so that the input voltage from the inverter to the motor conforms to the voltage and frequency indicated on the nameplate. (In the case of inverter motors, the base frequency must be 60 Hz.) In addition, do not directly connect the inverter motor without an inverter because doing so will result in drastic current increases due to voltage changes (except in cases of operation for only a short time, such as test runs or emergency runs). This phenomenon occurs frequently at 50 Hz.
- Be sure to set the base frequency of the inverter at 60 Hz.
- If 100% torque is required at low frequencies, apply a torque boost with the inverter as necessary. Continuous operation for a long time with too much torque boost applied will cause overheating, and should be avoided.
- The motor may resonate depending on the revolution speed and frequency. When operating continuously, avoid the resonance frequency by, for example, changing the carrier frequency setting of the inverter.
- When the load is low, for example, at the time of a trial run, the current may become large at low frequencies. This is due to motor characteristics and does not indicate an abnormal condition. It is possible to decrease the current by changing the setting of the inverter (reducing the torque boost, reducing the V/F ratio, and/or adjusting the torque vector).
- To protect the motor from overheating, use an electronic thermal relay set to general-use motor specifications, or install a thermal relay between the inverter and the motor.
- For brake-equipped models, refer to the wiring diagram on pages 211-213. Braking at high frequencies, above 60 Hz, may cause mechanical damage or excessive wear on the lining of the brake.

■ When an IE3 Motor Is Continuously Inverter-Driven

Supporting capacities: 0.75 kW to 5.5 kW, IE3 motor

1. Torque characteristics

For the frequency and torque characteristics, refer to the graphs to the right.

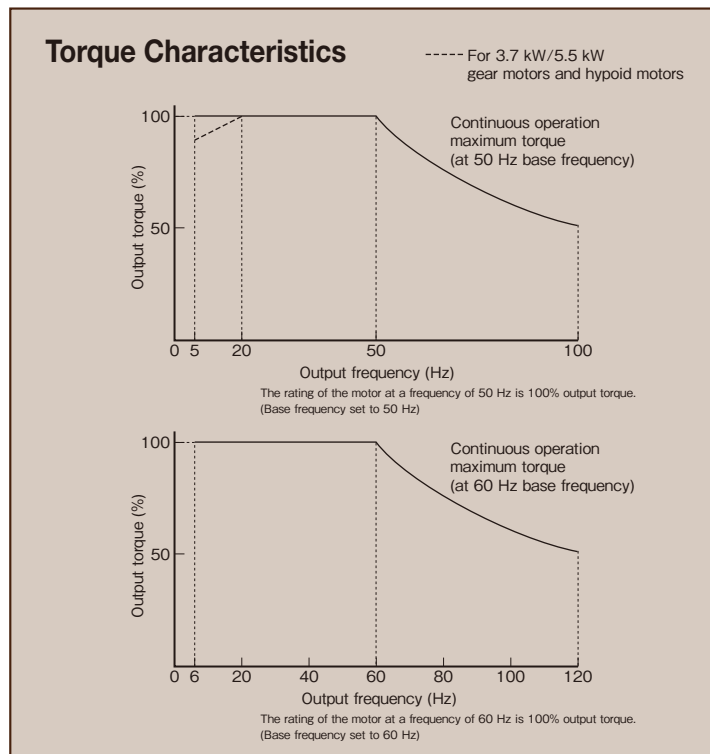

- At high frequencies, the torque decreases in reverse proportion to the revolution because of the constant kW. The motor noise, motor fan noise, reducer noise, and vibration increase because the revolution speed is high.
- At low frequencies, the temperature increases largely because the operating efficiency and cooling efficiency of the motor decrease.

2. Brake type

- Because the brake requires a fixed power supply (frequency, voltage), set up the brake circuit separately. For the standard product, the brake lead wire and motor lead wire are shipped screwed together. Therefore, remove the screw and connect each lead wire separately.
- Perform braking at 60 Hz (1800 r/min) or less. Braking at high frequencies, above 60 Hz, may cause mechanical damage or excessive wear on the lining of the brake.

3. Precautions

- At frequencies of 60 Hz to 120 Hz at a base frequency of 60 Hz, and frequencies of 50 Hz to 100 Hz at a base frequency of 50 Hz, as with the standard motor, there is a characteristic zone with constant horsepower and limited output torque. Care should therefore be taken with the load torque.
- Be sure to adjust the output voltage of the inverter so that the input voltage from the inverter to the motor conforms to the voltage and frequency indicated on the nameplate.
- If 100% torque is required at low frequencies, apply a torque boost with the inverter as necessary. Continuous operation for a long time with too much torque boost applied will cause overheating, and should be avoided.
- The motor may resonate depending on the revolution speed and frequency. When operating continuously, avoid the resonance frequency by, for example, changing the carrier frequency setting of the inverter.
- When the load is low, for example, at the time of a trial run, the current may become large at low frequencies. This is due to motor characteristics and does not indicate an abnormal condition. It is possible to decrease the current by changing the setting of the inverter (reducing the torque boost, reducing the V/F ratio, and/or adjusting the torque vector).
- In order to prevent the motor from overheating, use an electronic thermal relay between the inverter and motor.
- When using inverter drive with a 400 V-class motor, dielectric breakdown may occur due to a high-voltage surge (micro surge) that occurs with switching of the inverter. Countermeasures are therefore needed for the motor (micro surge protection). Standard 400 V-class-and-higher motors come standard with micro surge protection. However, for 1250 V and higher, install a suppression filter or a reactor on the inverter side.
- Increased temperatures, noise, and vibration result when compared with using a commercial power supply.

Outdoor Specification (Option Code: W)

Install the outdoor-type motor in a place with minimal dust. If installing in a place exposed to strong water flows, heavy rain, vapor, or snow, cover the motor appropriately. If the ambient temperature is 40° C or higher, protect it with a heat-insulating cover. Consult with Tsubaki before installing the motor on a sloped surface. Be sure that the terminal box outlet port is not subject to direct water spray or splashing.

Gear Motors, Hypoid Motors, Croise Motors

1. Terminal box positions and dimensions

Note: When using foot mount for the gear motor, the terminal box interferes with tools and bolts in some models. The type of bolt should therefore be restricted to the following.

- GMTA010 (020)-18L: Thread length of bolts should be M 8-25 or less.
- GMTA020-28L: Hexagon socket head bolts should be used.

Motor capacity	A	B
0.1 kW	52.5	118
0.1 kW*1	90.5	118
0.2 kW	90.5	118
0.4 kW	90.5	118
0.55 kW*1	90.5	118
0.75 kW	91.5	136.5
1.5 kW	90	157
2.2 kW	108	166
3.7 kW	112	179
5.5 kW	136.5	214

Note: The entire length is the same as that of the indoor-type standard product.

*1 Applies to Croise motors.

2. Construction of the terminal box

3. Changing the position and outlet direction of the terminal box

The position and outlet direction of the terminal box can be changed in swings of 90° and 180°. Refer to the model number table and use an option code to instruct us to change the position.

Hypoid Motor Mini Series

1. Terminal box positions and dimensions

Motor capacity	A	B
40W	83 (126)	98
60W	91 (134)	106
90W	91 (134)	106

The dimensions in parentheses are for brake-type models.

2. Changing the terminal box outlet direction

The outlet direction of the terminal box can be changed by 90°. If a change is necessary, inform us at time of order.

■ Hard Terminal Box (Option Code: H)

Aluminum terminal box is the same as the one for outdoor specifications.

Supporting capacities: 0.1 kW to 0.75 kW

- Terminal box positions and dimensions
 - Terminal box construction
 - Changing position and outlet direction
- All are the same as for the outdoor terminal box.

■ Resin Terminal Box (Mini Series)

Hypoid motor Mini series

Motor capacity	Reduction ratio	A	B
40 W	1/5 to 1/240	70	72
60 W	1/5 to 1/240	77	80
90 W	1/5 to 1/240	77 (99)	80

The dimensions in parentheses are for single-phase 90 W motors.

■ One-Touch Manual Release (Option Code: Q)

The brake of the motor can be released with a one-touch manual release function.

Supporting capacities: Three-phase 0.1 kW to 5.5 kW

Gear Motors, Hypoid Motors, Croise Motors (0.1 kW to 2.2 kW)

Gear Motors, Hypoid Motors (3.7 kW, 5.5 kW)

Note: Changing the position of the terminal box may change the phase of the arm. Confirm using a diagram or other documentation.

■ Manual Shaft (Option Code: M)

This is available for manual revolution from the motor fan side.

Supporting capacities: 0.1 kW to 2.2 kW

Note: Croise motors with 0.75 kW to 2.2 kW ratings are made-to-order products.

Supports 0.1 kW to 2.2 kW gear motors, hypoid motors and croise motors with brake.

Using a commercially available hex key, turn the hexagon socket (M6, opposite side distance of 5 mm) located in the center of the fan cover of the motor. Be sure to do so with the brake released manually. Never manually turn the unit during operation.

The motor configuration for 1.5 kW and 2.2 kW models is different. Refer to the diagram on the right.

■ Brake 400 V Direct Input Specifications (when operating separately from 400 V AC)

Capacity of 0.1 kW to 0.75 kW. Direct input of 400 V to the brake is possible. 200 V power supply is unnecessary when operating the brake separately. The brake parts will also change, so in that case please inform us at time of order. (The DC module is built into the hard terminal box.)

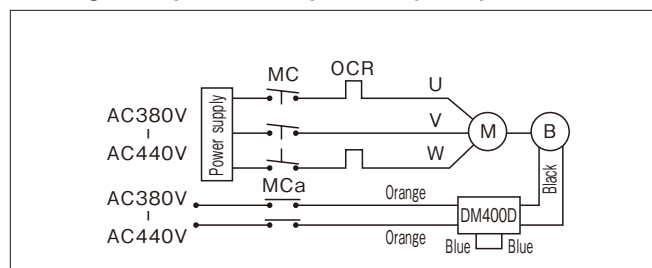

Supporting capacities: 0.1 kW to 0.75 kW

Ready for CE, UL, and CCC.

Brake specifications

Capacity	Brake model number	DC module model number	Voltage
0.1 kW	SLB01 180V	DM400D	180 V DC
0.2 kW	SLB02 180V		
0.4 kW	SLB04 180V		
0.55 kW	SLB04 180V		

Wiring for separate AC operation (400 V)

■ Continuous Rating Specifications for the Outdoor Brake Type

Outdoor specifications for the brake type can be used in continuous rating. Because 0.75 kW to 2.2 kW devices are made to order, please contact Tsubaki regarding these.

Supporting capacities: 0.1 kW to 2.2 kW

Hypoid Motors, Gear Motors

- 0.2 kW to 0.75 kW **Option code: BWC**
- 0.1 kW, 1.5 kW, 2.2 kW **Option code: BW**

Croise Motors

- 0.1 kW to 0.75 kW **Option code: BWC**
- 1.5 kW to 2.2 kW **Option code: BW**

Croise motor		●	●	● Note	● Note	● Note	●	●

Note: Croise motors HCMA series 0.4 kW (reduction ratios: 1/240 to 1/300), 0.55 kW (reduction ratios: 1/180 to 1/300), and 0.75 kW (reduction ratios: 1/90 to 1/300) are fitted with a pressure vent on the reduction section. Consequently, the protection rating for these models is IP54.

■ Raised Base for Hypoid Motor

When foot mounting is used for the hypoid motor, the motor protrudes beyond the attachment surface. There is a raised base to be used in this case.

Installation example (shaded part)

Base model number	Motor capacity	Reduction ratio	Motor model number	Dimensions								
				A	B	C	D	E	F	G		
HM38LBA	0.75 kW	1/5-1/50	HMTR075-38L5-50	L T R	(B)	188	164	25	12.5	13	13	103

2.2 kW	1/5-1/60	HMTR220-42L5-60	(B)		228	196	30	15	17	17	125	

Note: The shaft height of the output shaft will be raised the height of the raised base.

Shaft Diameters Available for the Hollow Shaft Type

1. Hypoid motors (Option code: S1 to S8)

Other than the standard shaft hole diameters, the following hole diameters are optionally available.

Supporting capacities: 0.1 kW to 5.5 kW

Note: The key used is JIS B1301-1976 (new JIS key).

Model number	Motor capacity	Speed ratio	Code Hole diameter key	Shaft diameter (H8) tolerance								
				S1 φ 20 (6×6)	S2 φ 25 (8×7)	S3 φ 30 (8×7)	S4 φ 35 (10×8)	S5 φ 40 (12×8)	S6 φ 45 (14×9)	S7 φ 50 (14×9)	S8 φ 55 (16×10)	
HMTA010-30H160 (B)~480 (B)	0.1 kW	1/160~1/480

SHOCK RELAY Type (Specification Code: SR)

Gear Motors, Croise Motors, Hypoid Motors

A reducer is equipped with an electric overload protection device. In case the motor current exceeds the set value due to an overload, SHOCK RELAY functions after a given time to stop the motor directly, thus protecting the machinery.

Model Numbering Example

Features

- The Shock Relay is built into the motor's terminal box, meaning no extra control panel is needed.
- The motor is instantly and directly stopped upon detection of the motor's current, so no sequence circuit is needed.
- Trip signal (1c contact) output can be utilized, for example, for an alarm lamp or to stop the motor.
- After eliminating the cause of the overload, the motor restarts simply by turning on the power.
- Compliant with CE.

Note: Cannot be used for inverter operation.

Explanation of operation

① Start time

Set to prevent SHOCK RELAY from operating due to the motor's inrush current. During this time, overload detection cannot be carried out.

② Overload trip

When an overload higher than the shock time set value is applied, SHOCK RELAY trips. During the overload trip, even when power is applied between U and W of SHOCK RELAY, the motor's current will be blocked.

③ Eliminating cause of overload trip

When eliminating the cause of the overload trip, be sure to turn off the power. The motor may restart due to a momentary power outage.

④ Recovery from overload trip

Turn the power back on (turn on MC). The motor restarts.

Note: Load current and shock time can only be set before shipment from Tsubaki. Contact Tsubaki about set values.

Supporting capacities

Hypoid motor Croise motor Gear motor	200 V class (Non-brake type)		
	0.1 kW	0.2 kW	0.4 kW
	○	○	○

Note: Please contact Tsubaki about 400 V-class products.

Ambient conditions

Temperature	0°C to 40°C
Humidity	Less than 85% (non condensing)
Mounting direction	No limitations on mounting angles: horizontal, vertical, or inclined
Vibration	4.9m/s ² {0.5G} or less (20 to 50 Hz)

Terminal box dimensions (all other dimensions are the standard except for the terminal box)

Note 1: 0.1 kW hypoid motors and gear motors have no fan or fan cover.

Note 2: Depending on the model, the dimensions partially differ. Contact Tsubaki for details.

Note 3: The terminal box direction varies depending on the model.

Hollow-Shaft POWER-LOCK Type (Specification Code: K)

Hypoid Motors, Croise Motors

A special hollow shaft with POWER-LOCK enables keyless coupling and gives rise to further hollow shaft functions. Mounting and unmounting are easy, and a reduced number of machinery device parts helps save space.

Model Numbering Example

HMTA040-35H120K

Hypoid motor

0.4 kW

Hollow shaft

Reduction ratio
1/120

POWER-LOCK type

Features

- There's no need for a keyway on the driven shaft.
- Mounting and unmounting of the reducer are easy.
- There's no backlash with the driven shaft.
- A special safety cap is available (shaft-end cover). (Hypoid motor: 0.1 kW to 0.4 kW, 0.75 kW, reduction ratios 1/5 to 1/50 only)

Hypoid motor specifications

Unit: mm

	0.75	1/60~1/200	45	55	100	45	210	200	PL055×100SL	M6×25	11.8 {1.2}
1.5		1/5~1/80									

Note 1: The driven shaft to be coupled to the hypoid motor hollow shaft should have a dimensional tolerance of φS h6, a finish length of dimension E or longer, and a surface roughness of 12S or less. The finished surface of the driven shaft should be located within the range indicated by E.

Note 2: For 0.1 to 0.4 kW and 1/5 to 1/50 of 0.75 kW, a special shaft-end cover is available.

Option: Shaft-end cover for hypoid motor

Croise motor specifications (made-to-order)

Rotary Encoder Type (Specification Code: E)

Gear Motors, Croise Motors, Hypoid Motors

By incorporating a rotary encoder on the motor shaft and utilizing the rotation signals of a hypoid motor, gear motor, and croise motor, various processes can be automated and operation streamlined.

Model Numbering Example

GMTA040-38L120BE

Gear motor 0.4 kW Foot mount Reduction ratio
1/120

Encoder type (brake type)

Features

- **Controllability** Open collector signals can be extracted from the reducer, making possible various operations.
- **Compact** Coupling is not necessary for connecting the motor shaft and the rotary encoder.
- **Cost saving** Unlike with the conventional separately placed types, coupling, base plate, and level adjustment processes are not necessary.

Construction and dimensions (rotary encoder mounting section)

1. Motor
2. Anti-load bracket with yoke
3. Fan cover
4. Encoder mounting plate
5. Encoder
6. Fixing screw
7. Motor shaft
8. Fixing screw
9. Fan (0.2 kW or more)

Standard item +Amm

Dimensions

The connection dimensions are the same as for standard items. Only the length is increased, as shown in the table below, because the motor fan cover is extended.

Motor output kw	Fan cover extension +Amm
0.1	61
0.2, 0.4	44
0.75	40
1.5	28
2.2	28.5

Supporting capacities

Motor capacity: 0.1 kW to 2.2 kW

Note: Dimensions are different for non-brake models. Please contact Tsubaki.

Actual reduction ratio of reducer

For the actual reduction ratios of hypoid and gear motors, refer to the specification charts of the inline reducer type. For the actual reduction ratios of Croise motors, refer to the specification charts.

Rotary encoder specifications

Power supply voltage	4.5 to 30 V DC
Pulse count	100 pulses
Output form	Open collector output (NPN type) 6 pcs AB90° phase difference signal + Z phase origin signal
Output circuit	<p>○ Vcc Power supply ○ Signal A,B,Z ○ 0V 0V common</p>
Current consumption	30 mA or less
Output voltage	0.5 V or less (max. pull-in)
Max. pull-in current	40 mA MAX
Signal rise/fall time	1 μ S or less
Max. response frequency	240 kHz
Output circuit resistance	50 V MAX
Cable length	0.5 m connector cable (DF3-6S-2C from Hirose Electric Co., Ltd.)
Vibration	4.9 m/s ² {0.5G} or less (20 to 50 Hz)

Wiring diagram

Pin no.	Color	Connection
1	Red	Power supply
2	Black	0V common
3	Blue	Signal A
4	White	Signal B
5	Yellow	Signal Z
6	Black	Shield

■ Pulsacion Type (Electromagnetic Encoder Attached) (Specification Code: E1)

Gear Motors, Croise Motors, Hypoid Motors

The motor has an integrated sensor that detects a permanent magnetic pole located on the motor shaft as a pulse string. This makes the magnetic encoder resistant to the surrounding environment and impact.

Supporting capacities

Motor capacity: 0.1 kW to 0.55 kW

Features

- Dimensions are nearly identical to those of standard gear motors.
- Can be used outside and in wet environments.
- Capable of speed control, position control, and overload detection.

Construction (Pulsacion section)

Compact in longitudinal direction

Pulsacion specifications

Power supply voltage	4.5 to 26.4 V DC (5 to 24 V ± 10%)
Pulse count	50 pulses
Output form	Open collector output (NPN type) 5 pcs AB90° phase difference signal
Output circuit	
Current consumption	50 mA or less
Output voltage	0.5 V or less (max. pull-in)
Max. pull-in current	10 mA MAX
Signal rise/fall time	10 μS or less
Output circuit resistance	30 V MAX
Cable length	0.5 m
Vibration	9.8 m/s ² {1G} or less (20 to 50 Hz)

Wiring diagram

Color	Connection
Red	Power supply
Black	0V common
Green or blue	Signal A
White	Signal B
Yellow	-
Shield	NC

Note: Can be made with a pulse count less than 50. Please contact Tsubaki.

SHOCK GUARD Type (Specification Code : G)

Croise Motors, Hypoid Motors

A product can be equipped with a mechanical overload protection device (SHOCK GUARD) developed exclusively for the hollow output shaft. In case of unexpected overload, the SHOCK GUARD activates to protect the machinery device. It is compact and easy to handle. (For non-brake types only.)

Model Numbering Example

Features

- After the cause of the overload is eliminated, the motor automatically re-engages and starts operation.
- Unique alignment of the ball and pocket gives a one-to-one combination of engaging positions.
- Simply rotate the adjustment nuts to adjust the trip torque.
- If combined with non-contact SHOCK GUARD sensors, an overload can be detected and the motor can be stopped or an alarm set off.

Construction, operating principle

1. Trip torque setting

- Set the trip torque of the overload protection device by adjusting the tightening angle of the adjustment nut.
 - (1) Place the nut on the driven shaft and tighten it manually. The condition with no clearance is set as the 0 point.
 - (2) Refer to the "Tightening amount-torque correlation diagram" to find the tightening angle of the adjusting nut that corresponds to previously determined torque trip, then tighten the nut. To find the tightening amount that matches an individual machine, the best way is to use the graph as reference and conduct test runs with the nut tightened only lightly.
 - (3) After setting the torque, secure the adjusting nut using the shaft washer.
 - (4) Do not turn the adjusting nut more than the maximum value on the "Tightening amount-torque correlation diagram." At the time of tripping, the disc spring loses its curvature and becomes locked.

Note: In some cases, the value on the specification chart (Items 145 to 148) is higher than the value on the torque correlation diagram. When setting the trip torque, be sure to set within the trip torque range.

2. Precautions

- In normal operations, no noise and vibration occur. However, when there is an unexpected overload, large noise and vibration may occur. In that case, immediately stop the device. In this case, using the TG sensor is recommended.

3. Recovery

- Because the device uses the self-recovery method, just restarting the drive side of the motor automatically resets the device.
 - (1) When the overload protection device activates due to an overload, stop revolution and eliminate the cause of the overload.
 - (2) At time of device recovery, reset (re-engage) by an input revolution count of 50 r/min. or lower, or by motor inching. If resetting proves difficult, conduct inching by applying a small amount of load. Do not reset by manually rotating the overload protection device and shaft. Doing so is dangerous.
 - (3) When the ball is inserted into the pocket, there should be a clicking sound.

Croise motor specifications (0.1 kW to 3.7 kW)

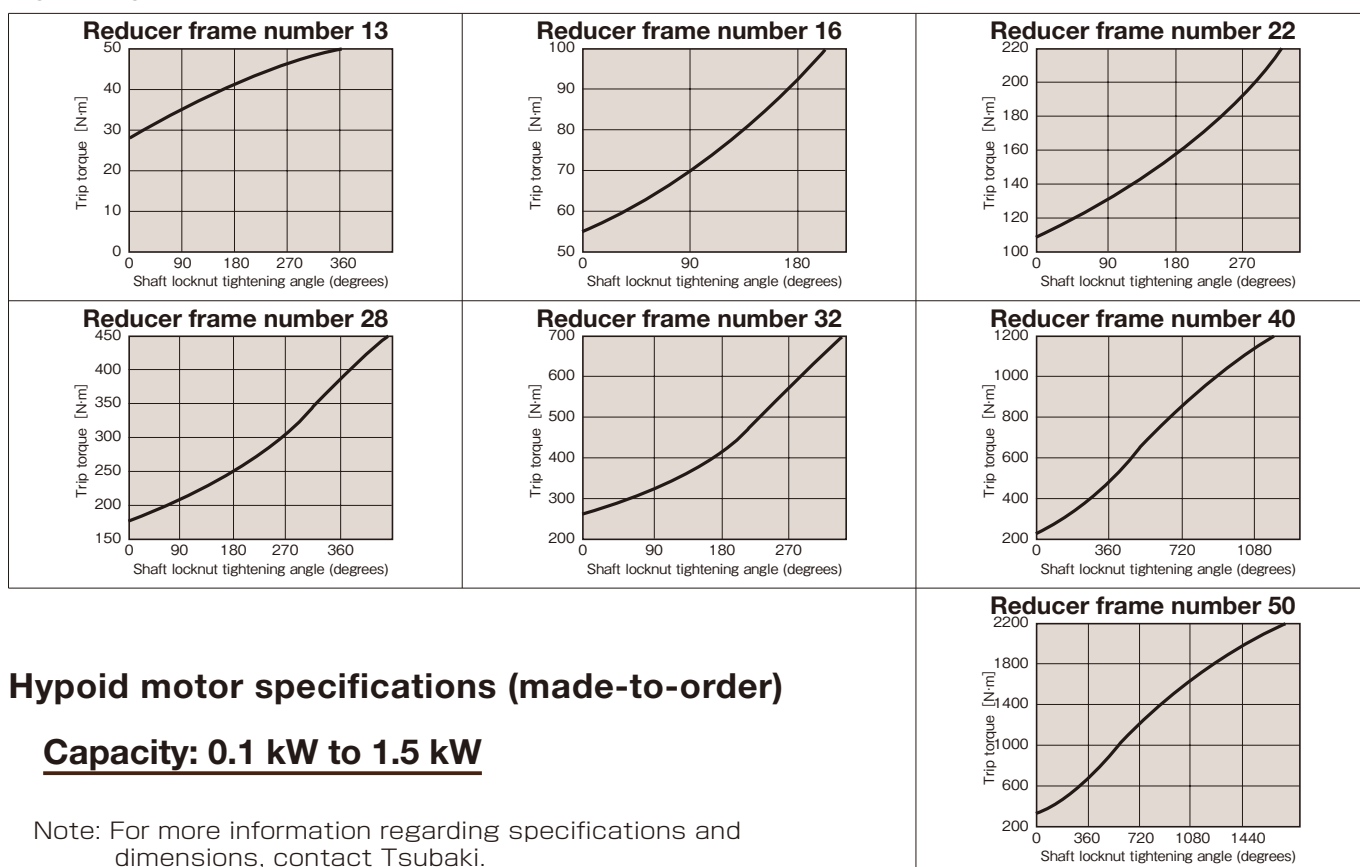

Unit: mm

Note: Dimensions are identical whenever the reducer frame number is the same. For front-view dimensions, refer to the outline dimensions of the hollow shaft type for each series.

Tightening amount–torque correlation charts

Hypoid motor specifications (made-to-order)

Capacity: 0.1 kW to 1.5 kW

Note: For more information regarding specifications and dimensions, contact Tsubaki.

Waterproof Type (Option Code: J)

Gear Motors, Hypoid Motors, Croise Motors

This small gear motor is waterproof with an IP65 rating. It can be used in applications, such as food processing machinery, subject to splashing and can be washed directly with water. A range of options allows it to be adapted to the application at hand.

Model Numbering Example

Basic specifications

- Motor protection level IP65 (0.1 kW to 0.4 kW)
IP55 (0.75 kW to 2.2 kW)
- Output shaft material S45C or SCM415
- Terminal box Aluminum die-cast (40 W to 0.75 kW)
Steel plate (1.5 kW, 2.2 kW)
- Urethane coating
- Paint color: Light silver metallic
- Exposed bolts are stainless steel
(Except fixing bolts for the reducer case and fan cover.)
- Fan cover Resin (0.2 kW to 0.4 kW)
Steel plate (0.75 kW to 2.2 kW)

Note: Specification values are the same as for standard items. Refer to the specification charts of each series.
 IP65: IP ratings indicate the level of protection against infusion of water and foreign objects. IP65 means the equipment is dust tight and protected against water projected from a nozzle from all directions.
 This product cannot be used in an environment with high-pressure water jets. If the anti-load side of the motor is on top, please contact Tsubaki.

Technical Information

Various Options

Select options for specific applications.

Fin-less motor frame (Aluminum)

0.1 kW to 0.4 kW

Hygienic: No mold and no accumulation of corrosive materials.

Brake

Brake type (continuous rating)
0.1 kW to 2.2 kW

Protection level: 0.1 kW to 0.4 kW IP65
0.75 kW to 2.2 kW IP65

Output shaft V-ring specifications (Hollow type)

The oil seal at the output shaft is protected from the outer environment.

Inverter motor type

Inverter motor can be directly attached. 100% constant torque operation is possible in the 6 Hz to 60 Hz range.

Stainless steel output shaft (SUS420J2)

Maximum protection against rust. Note that this may not be supported for certain reduction ratios.

Steel-plate motor fan cover

0.2 kW to 0.55 kW

For outdoor use, a steel cover with high weatherability is recommended.

Coating

Epoxy resin coating

Highly resistant to chemicals. Ideal for when acid-alkali cleaning solutions are used.

Chlorinated rubber coating

Highly adhesive to the coating film. Highly waterproof and corrosion-proof. Note: Color except silver.

Hypoid motor Keyless coupling

(POWER-LOCK)
0.1 kW to 0.75 kW

Attaching a POWER-LOCK to the special hollow shaft allows keyless coupling. No key groove processing is required, and mounting and unmounting are easy. No need for countermeasures against loosening and falling off. No backlash occurs between the driven shaft and the hollow shaft.

For information about other options, please consult us.

Heat-Resistant Type (Option Code: A1)

Gear Motors, Hypoid Motors

These motors can withstand continuous operation in environments such as ovens, where the ambient temperature is always high.

Model Numbering Example

Gear Motor

GMTA040-24L25BA1

Heat-resistant type

Applicable temperature range: 0°C to 60°C
(without dew condensation)

Specifications

- Output shaft torques of all models are the same as those of standard items (no limitation).
- External dimensions of all models are the same as those of standard items.
- The brake-equipped DC module (dedicated product) should be installed separately in a location where the ambient temperature is 40° C or lower.

Note: Inverter operation is not available.
Inverter motor type is not supported.

Model lineup

Gear Motor TA and TR Series

Non-brake, With Brake

Technical Information

Just Fit Models

Cold-Resistant Type (Option Code: A2)

Gear Motors, Hypoid Motors

These motors can withstand continuous operation in environments such as refrigerated warehouses where the ambient temperature is always low.

Model Numbering Example

Hypoid Motor **HMTR150-45H200A2**
Cold-resistant type

Applicable temperature range: -30°C to 40°C
 (without frost and dew condensation)

Specifications

- Output shaft torques of all models are the same as those of standard items (no limitation).
- Hard terminal box or steel-plate terminal box.
- Steel-plate fan cover.
- The brake-type model has a fully enclosed brake cover.
- Solvent paint is outdoor specifications.

Note 1: External bolts are the same as those of standard items.
 Note 2: After a long stoppage, there is a large no-load loss restart.

Food Contact Type (Option Code: FS)

Gear Motors, Hypoid Motors

The GMTA, GMTR, HMTA, and HMTR series are compatible with food-grade lubricant, which is in high demand among food processing machinery users. These series use light gray antibacterial baked coating, and the terminal box and fan cover are made of resin-free steel plates. Choose from a wide-ranging lineup for food machinery and proprietary options.

Global Series

Gear Motors, Hypoid Motors

Global Series motors are compatible with worldwide directives, regulations, and systems. We have CE-compatible motors for Europe, UL-compatible motors for North America, and CCC-compatible motors for China. We also have Triple 200 products, in which each motor complies with all three standards—CE, UL, and CCC.

Note: For models for South Korea, see page 255.

CE

EU countries

CE

- ▶ **CE conformity**
Products exported to Europe must bear CE marking to show that they satisfy the safety requirements of applicable EC directives. Products have CE conformity if they bear the CE mark.
- ▶ **Declaration Conformity**
Manufacturers can carry out self-declaration for CE conformity.
Relevant directive: Low Voltage Directive 73/23/EEC
Relevant regulation: EN60034-1 (regulation for rotating electrical machines)

UL

United States
Canada

UL

- ▶ **UL conformity**
UL (Underwriters Laboratories) is an American third-party organization that tests and approves products for consumer safety. Products have UL conformity if they bear the UL mark. Our C-UR model has been approved by UL, as well as by the CSA (Canadian Standards Association).
- ▶ **UL specifications**
Relevant directive: UL1004
UL file no: E225995

CCC

China

CCC

- ▶ **CCC conformity**
Motors 1.1 kW and smaller exported to China must bear the CCC mark to show that they satisfy the CCC system for product quality standardization.
- ▶ **Permission to use CCC mark**
Tsubaki has been certified by the CQC (China Quality Certification Center).
National standard: GB12350

1. Motors for Europe (Option Code: N)

Products exported to Europe must bear CE marking to show that they satisfy the safety requirements of applicable EC directives.

Relevant Directives and Regulations

Directive: Low Voltage Directive 2014/35/EU

Regulation: EN 60034-1 (regulation for rotating electrical machines)

In addition, 0.75 kW to 375 kW motors must satisfy criteria for IE3 premium efficiency class (IEC 60034-30) under Commission Regulation (EC) No. 640/2009.

Note 1: 0.55 kW is for Croise motors only.

Note 2: The terminal box shape differs from the standard type. Please contact Tsubaki.

Note 3: On models, connections differ from the standard type. Please contact Tsubaki.

Note 4: 3.7 kW and 5.5 kW are for hypoid motors and croise motors only.

2. Motors for North America (Option Code: N2)

UL (Underwriters Laboratories) is an American third-party organization that tests and approves products for consumer safety. Our C-UR model has been approved by UL, as well as by the CSA (Canadian Standards Association).

In addition, 0.75 kW to 375 kW motors must satisfy criteria for IE3 premium efficiency class (NEMA Premium) under the EISA (Energy Independence and Security Act) high-energy-efficiency regulations in the U.S., and the IE3 premium efficiency class (CSA C390) under the EEAct (Energy Efficiency Act) high-energy-efficiency regulations in Canada.

Note 1: Contact Tsubaki about production of 380 V/60 Hz products.
 Note 2: 3.7 kW and 5.5 kW are for hypoid motors and croise motors only.

Technical Information
Just Fit Models

5. Standardized Motors for Europe, North America, and China

TRIPLE 200 (Option Code: N4)

One motor conforms to three standards: EU, UL, and CCC.

These models are ideal for machine tools and peripheral equipment that are shipped around the world. Since there's no need to worry about conforming to each different standard, you can have unified specifications and reduce stock.

Model Numbering Example

Gear motor **GMTA040-28U200N4**
|
TRIPLE200

Supporting Capacities: 0.1 kW to 0.4 kW

Voltage: 200/200/220 V, 50/60/60 Hz

- Gear motor TA Series
- Hypoid motor TA Series
- Croise motor

Relevant EU Directives and Regulations

Directive: Low Voltage Directive 2006/95/EC
 Regulation: EN 60034-1

Relevant North American Directive and Regulation File No.

Directive: UL 1004
 UL file no.: E225995

China National Standard: GB12350

Terminal Box Specifications

6. Other Combinations

Products can also be made to correspond to any two of the three standards. Please contact Tsubaki.

Option code: N5 → +

Option code: N6 → +

Option code: N7 → +

■ Voltage of Each Country (Reference)

Country/region	Frequency (Hz)	Voltage (single-phase)	Voltage (three-phase)	
Japan	50/60	100/200	200/400	
North America	United States	60	115/230	
	Canada	60	120/347	
			208/240/600	
Asia	India	50	240	
	Indonesia	50	220	
	South Korea	60	110/220	
	Singapore	50	230	
	Thailand	50	220	
	Taiwan	60	110/220	
	China	50	220	
	Philippines	60	220	
	Hong Kong	50	200	
	Malaysia	50	240	
	Oceania	Australia	50	220
		New Zealand	50	230
Europe	United Kingdom	50	230	
	Italy	50	220	
	Austria	50	220	
	Netherlands	50	230	
	Greece	50	230	
	Switzerland	50	230	
	Sweden	50	230/400	
	Spain	50	127/220	
	Denmark	50	230	
	Germany	50	230	
	Norway	50	220/230	
	Hungary	50	220	
	Finland	50	230	
	France	50	230	
	Bulgaria	50	230	
	Belgium	50	230	
	Poland	50	220	
	Portugal	50	230	
	Romania	50	220	
	Luxembourg	50	230	

Note: Voltage may differ from the above even within the same country depending on the region.

This section describes general use of gear motors, hypoid motors, and croise motors. For a more detailed explanation, refer to the motor's instruction manual.

■ Inspection upon Receipt of Product

When you receive the product, check that:

- (1) The outlet, reduction ratio, model number, voltage, and other items on the nameplate match the product you ordered.
- (2) All accessories (such as pressure vent) are provided.
- (3) No parts were damaged during transport.
- (4) No screws or nuts are loose.

If there are any problems or questions, contact the dealer.

1. How to to read the nameplate

0.1 kW to 0.4 kW

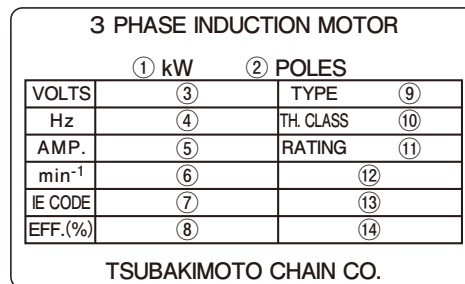

0.75 kW to 5.5 kW

Reducer Nameplate

Motor Nameplate

①	Output
②	No. of poles
③	Voltage
④	Frequency
⑤	Rated current
⑥	Revolution speed
⑦	IE code
⑧	Nominal efficiency
⑨	Type
⑩	Insulation
⑪	Rating
⑫	Applicable standard
⑬	Protection
⑭	Serial number

Labeling for IE3 motor

When you make an inquiry, provide us with the following information from the nameplate:

- ① TYPE (model number), ② RATIO (reduction ratio),
- ③ MFG.NO. (serial number), ④ DRAWING.NO. (drawing number)

■ Storage

If you will not be using a gear motor for a while, store it under the following conditions.

1. Storage place

Store indoors in a clean, dry place.

Do not store outdoors, in humid or dusty places, or in places subject to extreme temperature changes and corrosive gases.

2. Storage position

Products are shipped and packed in the direction they will be mounted. Store them in this same mounting direction (i.e., proper up and down direction). If products are made for special installation, storing them in the wrong storage position may result in bearing section grease mixing with lubricating oil and spilling out.

3. Storage period

- (1) Do not store products for more than six months.
- (2) If products are to be stored for more than six months, they will require special rust-proofing specifications. Please contact Tsubaki.

4. Usage following storage

- (1) Non-metal parts such as the oil seal, oil gauge, and oil supply plug tend to deteriorate due to environmental factors. Inspect those sections before starting operation, and if there is any deterioration, replace with new parts.
- (2) When starting the motor, make sure there is no unusual noise, vibration, or heat generation. If there is, immediately contact the dealer.

Installation

1. Mounting direction

- Gear motors, hypoid motors, mini series
Motors can be mounted horizontally, vertically, or on an incline. There are no restrictions on mounting direction.
- Croise motors
CSMA/CSMR series
There are no restrictions on the mounting direction for reducer frame numbers 13 to 28. They can be mounted horizontally, vertically, or on an incline.
Horizontal mounting is the standard installation for reducer frame numbers 32 to 50. For other mounting directions, please consult with Tsubaki when placing the order.
- HCMA/HCMR series
Horizontal mounting is standard. For other mounting directions, please consult with Tsubaki when placing the order.

Installation

1. Foot mount type

- Use a strong flat surface that is not susceptible to vibration during operation. Remove any dust and foreign matter on the mounting surface before attaching the four bolts.
- When coupling the reducer, make sure the shaft is precisely centered. If it is not, this will shorten the life of the bearing, gear, and shaft, and cause noise and vibration.
- Center the chain and belt precisely and adjust the tension so that the load applied to the output shaft does not exceed the specified value.
- During coupling, be sure not to forcefully hit the output shaft, coupling, pulley, or sprocket. Doing so may damage the output shaft bearing.

2. Flange mount type

- Use a strong flat flange mounting plate that is not susceptible to vibration during operation. Remove any dust and foreign matter on the mounting surface before attaching the four bolts.
- When coupling the reducer, make sure the shaft is precisely centered. If it is not, this will shorten the life of the bearing, gear, and shaft, and cause noise and vibration.
- Center the chain and belt precisely and adjust the tension so that the load applied to the output shaft does not exceed the specified value.
- During coupling, be sure not to forcefully hit the output shaft, coupling, pulley, or sprocket. Doing so may damage the output shaft bearing.

3. Face mount type

- When attaching the motor to the machine, use a tap of the case.
- When coupling the reducer, make sure the shaft is precisely centered. If it is not, this will shorten the life of the bearing, gear, and shaft, and cause noise and vibration.
- Center the chain and belt precisely and adjust the tension so that the load applied to the output shaft does not exceed the specified value.
- During coupling, be sure not to forcefully hit the output shaft, coupling, pulley, or sprocket. Doing so may damage the output shaft bearing.

4. Hollow shaft type

4-1. Mounting to the driven shaft

- The internal diameter of the hollow shaft is manufactured to JIS H8 tolerance. For normal applications, the finish of the driven shaft should be h7. For applications involving large shock or radial load, use a slightly tighter fit of js6 or k6.
- When installing to the driven shaft, apply molybdenum disulfide grease to the driven shaft surface and hollow output shaft internal diameter before inserting.
- Use the jig shown on the right for smooth insertion.

4-2. Fixing to the driven shaft

A. When there are steps on the driven shaft
Fabricate the end plate as shown in the figure below. Fix the hollow output shaft and driven shaft.

B. When there are no steps on the driven shaft
There are the following two types of fixing methods.

4-3. Preventing the torque arm from rotating

- Mount the torque arm to the driven-machine side of the hypoid motor. Mount using a hex bolt. Provide sufficient clearance for the rotation stopper of the torque arm between the hypoid motor and the driven shaft. Do not fix the torque arm with a rotation-preventing bolt. If there is no clearance, the bearing in the reducer will get damaged.
- When the motor is started and stopped frequently or when it is repeatedly run forward and then reversed, install a rubber bush between the torque arm and the rotation-preventing bolt (or spacer) to reduce shock.

4-4. Removal from the driven shaft

- Remove the driven shaft from the hollow shaft while making sure that excessive force is not applied between the housing and hollow output shaft.
- Use the jig shown on the right for smooth removal.

Recommended plate dimensions (HMMT, HMTA, HMTR, Croise Motor)

Applicable product (frame number example)	Output hollow shaft hole diameter	Plate			Stop ring size
		φD	T	Z	
HMMT40	φ18	17.5	8	M8	C18
HMTA - Frame 20	φ20	19.5	6	M8	C20
HMMT60 · 90	φ22	21.5	8	M8	C22
CSMA - Frame 16	φ25	24.5	9	M10	C25
HMTA - Frame 30 CSMA-Frame 22	φ30	29.5	9	M12	C30
HMTA-Frame 35	φ35	34.5	12	M12	C35
CSMA - Frame 28	φ40	39.6	12	M12	C40
HMTA-Frame 45	φ45	44.5	15	M16	C45
CSMA-Frame 32	φ50	49.5	12	M16	C50
HMTA-Frame 55	φ55	54.5	18	M18	C55
CSMA-Frame 40	φ70	69.5	14	M24	C70

Torque arm design

Whether a standard torque arm is used or whether you design and make a torque arm, check the strength of each element in the following manner.

1. Check the torque arm and fixing bolt.
Check according to the torque arm reaction force R.

$$R = \frac{T + W \times G}{C}$$

2. Selection of bearing
Check according to the bearing reaction forces A and B.

$$A(\text{shaft bearing a}) = \frac{L1 \times (R - W) - D \times R}{L2}$$

$$B(\text{shaft bearing b}) = \frac{(L1 + L2) \times (R - W) - D \times R}{L2}$$

T : Output torque N·m (kgf·m) C : Distance between center of driven shaft and rotation stopper (m)
 W : Weight of reducer kg (kgf) D : Distance between center of reducer and rotation stopper (m)
 R : Torque arm reaction force kg (kgf) L1 : Distance between center of reducer and bearing b (m)
 G : Distance between center of driven shaft and center of gravity of reducer (m) L2 : Distance between bearing a and bearing b (m)

Note: For the direction of rotation shown in the figure to the left, the output torque is positive. When it is reversed, the output torque is negative.

Dimensions when optional torque arm is used (approximate value)

Also applies to adapter and inline reducer types.

■ Operation

1. Inspection before starting

After installation and wiring are completed, check the following items before turning on the switch.

- Confirm that the appropriate breaker and overcurrent relay are used.
- Confirm that the wiring is correct.
- Confirm that the installation wires are securely connected.

In addition, take measures to prevent dangers. For example, take appropriate measures when dangers can be expected during the operation of gear motors, hypoid motors, or croise motors, and take appropriate measures when these motors stop working properly.

2. Fluctuation of voltage and frequency

When the voltage and frequency applied to the motor are not specified values, characteristics may change. A fluctuation in the motor voltage of +/- 10% of the rated voltage will not affect operation.

3. Trial operation

Shipped products have not undergone trial operation. For croise motors in particular, to demonstrate proper performance, a trial run should be conducted for a period of about one day by applying a load on the order of one-half to one-third of full load.

4. Load

A load higher than the specified value may shorten the life of the motor and gear, and may damage the gear motor, hypoid motor, and croise motor. Rated current values are written on the nameplates of the gear motor, hypoid motor, and croise motor. Be sure not to exceed these values.

5. Inspection after starting

After starting operation, inspect the following items.

- a. Confirm that the direction of rotation is correct.
- b. Confirm that the maximum value of the current is within the value specified on the nameplate.
- c. Confirm that there is no abnormal vibration or noise.
- d. Confirm that startup is not too frequent.
- e. Confirm that there is no shock.

■ Maintenance

Conducting daily maintenance requires only that the operators use measuring tools and their senses. Check the following.

- Noise: Make sure that noise is not louder than usual and that there are no periodic abnormal sounds.
- Vibration: Make sure there is no abnormal vibration.
- Temperature: Make sure the motor temperature is not higher than usual.

■ Grease Lubrication (Gear Motor, Hypoid Motor, Mini Series)

1. Grease lubrication

Grease is used for lubrication.

2. Grease injected

A specified amount of lead-free grease is already injected prior to delivery. Use the motor as is.

3. Grease change

Changing or replenishing grease is usually not necessary. However, changing the grease after 20,000 hours of operation will prolong the life.

4. Grease specifications

Use grease for high-grade gears with a viscosity No. 000 or equivalent.

5. Recommended grease

Nippon Grease Co., Ltd.: Nigtight LMS No. 000 (This is the lead-free grease injected before delivery.)

Showa Shell Sekiyu K.K.: Alvania EP Grease R000

JXTG Nippon Oil & Energy Corp.: Pyronoc Universal 000

6. Grease quantity

Gear Motor TA and TR Series

- Gear motor
- Brake-type gear motor
- Inline reducer
- Adapter type reducer

Motor output	Reduction ratio	Grease quantity kg
0.1 kW	1/10 - 1/50	0.14
	1/5 · 1/60 - 1/200	0.3
0.2 kW	1/10 - 1/25	0.14
	1/5 · 1/30 - 1/75	0.3
	1/100 - 1/200	0.5
0.4 kW	1/5 - 1/25	0.3
	1/30 - 1/75	0.5
	1/100 - 1/200	1.1
0.75 kW	1/5 - 1/25	0.5
	1/30 - 1/75	1.1
	1/100 - 1/200	1.3
1.5 kW	1/5 - 1/30	1.3
	1/40 - 1/75	1.4
2.2 kW	1/5 - 1/30	1.3

Note: The values in parentheses are for the 1st step speed reduction part of the 4-step speed reduction (1/300 to 1/1200).

Hypoid Motor TA and TR Series

(H: Hollow shaft, U: Face mount)

Motor capacity	Frame number		Reduction ratio	Grease quantity kg
	H	U		
0.1 kW	20	22	1/5 - 1/50	0.27
			1/60 - 1/120	0.23
	30	24	1/160 - 1/200	0.33
		28	1/300 - 1/480	0.33+(0.15)
0.2 kW	20	22	1/5 - 1/25	0.27
			1/30 - 1/60	0.23
	35	38	1/80 - 1/200	0.33
			1/300 - 1/480	0.53+(0.15)
			1/600 - 1/1200	1.15+(0.20)
0.4 W	30	28	1/5 - 1/50	0.33
			1/60 - 1/200	0.53
	45	42	1/300 - 1/480	1.15+(0.40)
			1/600 - 1/1200	3.80+(0.40)
0.75 kW	35	38	1/5 - 1/30	0.67
			1/40 - 1/50	0.53
	55	50	1/300 - 1/480	3.70+(0.70)
1.5 kW	45	42	1/5 - 1/30	1.40
			1/40 - 1/80	1.15
2.2 kW	45	42	1/100 - 1/200	3.80
			1/5 - 1/20	1.40
	55	50	1/25 - 1/60	1.15
3.7 kW	55	50	1/80 - 1/120	3.80
			1/5 - 1/20	3.70
5.5 kW	55	50	1/25 - 1/60	3.40
			1/5 - 1/20	3.70
			1/25 - 1/40	3.40

Note: The values in parentheses are for the 1st step speed reduction part.

(L: Foot mount)

Motor capacity	Frame number	Reduction ratio	Grease quantity kg
0.1 kW	22	1/5 - 1/50	0.23
		1/60 - 1/120	0.23
	24	1/60	0.40
		1/80 - 1/200	0.33
		28	1/300 - 1/480
0.2 kW	22	1/600 - 1/1200	0.53+(0.15)
		1/5 - 1/50	0.23
	28	1/60	0.23
		1/60	0.40
		1/80 - 1/200	0.33
0.4 W	38	1/300 - 1/480	0.53+(0.20)
		1/600 - 1/1200	1.14+(0.20)
	42	1/600 - 1/1200	3.80+(0.40)
0.75 kW	28	1/5 - 1/50	0.33
		1/60 - 1/200	0.53
	42	1/300 - 1/480	1.14+(0.40)
1.5 kW	50	1/600 - 1/200	3.80+(0.40)
		38	1/5 - 1/50
	42	1/60 - 1/200	1.15
2.2 kW	42	1/300 - 1/480	3.70+(0.70)
		1/5 - 1/30	1.40
	50	1/100 - 1/200	3.80
3.7 kW	50	1/5 - 1/20	1.40
		1/25 - 1/60	1.15
5.5 kW	50	1/80 - 1/120	3.80
		1/5 - 1/20	3.70
		1/25 - 1/60	3.40
		1/5 - 1/20	3.70
		1/25 - 1/40	3.40

Hypoid Motor Mini Series

Motor capacity	Reduction ratio	Grease quantity g
40 W	1/5 - 1/60	180
	1/80 - 1/240	150
60 W	1/5 - 1/60	300
	1/80 - 1/240	230
90 W	1/5 - 1/60	300
	1/80 - 1/240	230

Oil Lubrication (Croise Motor)

1. Oil lubrication

Oil is used for lubrication.

2. Oil injected

A specified amount of oil (Daphne Alpha Oil TE260) is filled at the time of delivery. Use the motor as is.

3. Oil change

- Reducer frame numbers 13 to 28 have a sealed structure. Consequently, replacing or refilling lubricating oil will not be necessary in most cases. However, if operating conditions cause severe deterioration in the lubricating oil, change the oil after 2,500 hours of operation. Doing so will extend the service life of the unit.
- For frame numbers 32 to 50, maintenance is as follows:
 - ① For the first time after initial start of operation, change the oil shortly after 1,000 hours of operation or after a period of three months.
 - ② For the second time onwards, change the oil shortly after every 5,000 hours of operation or every year depending on operating conditions.

4. Pressure vent

- Reducer frame numbers 13 to 28 have a sealed structure. Consequently, no pressure vent is necessary.
- For frame numbers 32 to 50, be sure to check that the reducer is mounted in the standard installation direction and then install the supplied pressure vent. After installation is complete, check the oil level using the oil gauge. For other than the standard installations, please specify at the time the order is placed.

5. Recommended lubricating oils

Manufacturer	Recommended lubricating oil
Industrial gear oil Class 2 (worm gear)	ISO VG320
EMG Lubricants	Mobile 600 W cylinder oil (ISO VG380)
	Spartan EP 320
Showa Shell Sekiyu	Omala S2 G 320
Idemitsu Kosan	Daphne CE compound 320S

Note: Maintenance when using the recommended lubricating oils in the table above is as follows:

- ① For the first time after initial start of operation, change the oil after 500 hours of operation.
- ② For the second time onwards, change the oil after every 5,000 hours of operation, depending on operating conditions.

6. Oil amounts (L)

Reducer frame number	CSMA/CSMR series			HCMA/HCMR series		
	Foot mount	Face mount	Hollow shaft	Foot mount	Face mount	Hollow shaft
13	0.13	0.05	0.05	—	—	—
16	0.20	0.10	0.10	0.37	0.37	0.29
22	0.36	0.24	0.24	0.7	0.7	0.6
28	0.55	0.55	0.55	1.4	1.4	1.2
32	1.0	1.0	1.0	1.6	1.6	1.4
40	1.2	1.2	1.2	2.8	2.8	2.5
50	3.3	3.3	3.3	5.3	5.3	4.7

Note 1: The oil amounts above are for standard mounting directions (mounting No. 0 or No. 1). Regardless of the motor kW and reduction ratio, the same amount of oil is used for reducers with the same frame numbers in the same series.

Note 2: For mounting No. 5 of the HCMA/HCMR series, increase the oil amount by 60% (approximate oil amount).

Oil Seal

A contact-type oil seal is used to seal the shaft of the speed reducer housing. In most cases, it is not necessary to replace the oil seal. If the oil seal is replaced after 10,000 hours of operation, though, the life of the reducer will be prolonged. Because the life of the oil seal depends on usage conditions, there may be cases where the oil seal needs to be replaced before 10,000 hours of operation.

If the product is used in equipment for which oil leakage should be particularly avoided, such as food processing machines, install an oil pan or similar device in preparation for unexpected oil leakage due to breakdowns, end of product life, or other reasons.

Note: In rare cases, grease discharges from the oil seal lip at the beginning of startup. This is only excess grease from filling during the assembly process; it does not indicate a function failure of the reducer.

■ Troubleshooting

1. Troubleshooting gear motors, hypoid motors, and croise motors

Problem	Possible cause	Action
Motor does not turn in unloaded state	Power outage	Check power supply, contact power company
	Broken connection wiring	Chec circuit
	Poor switch contact	Repair or replace
	Broken stator coil wiring	Send to repair plant
	Three-phase is single-phase	Check terminal voltage
Motor does not turn when load is applied	Gear/shaft/bearing damage	Send to repair plant
	Voltage drop	Check length of wiring
	Gear wear	Send to repair plant
Abnormal heat	Overload operation	Reduce load
	Motor is stopped/started too frequently	Reduce frequency
	Bearing damage	Repair or replace
	Voltage is too high or too low	Check voltage
Noisy	Continuous noise: Bearing damage, gear wear	Send to repair plant
	Intermittent noise: Scratched gear of foreign matter in machinery	Send to repair plant
Large vibration	Gear/bearing wear	Send to repair plant
	Faulty mounting, loose bolt	Re-tighten
Grease leakage	Loose tightened parts	Re-tighten
	Oil seal damage	Replace

2. Troubleshooting gear motors, hypoid motors, and croise motors with brake

Problem	Possible cause	Action
Brake does not work	Incorrect wiring	Check wiring
	Switch is faulty	Replace or repair
Brake is not effective Braking time is long	Oil, dirt, or other contaminant on lining	Overhaul
	Life of lining exceeded	Replace or repair
	Inertia of load is too large	Reduce inertia of load
	Brake is wired across motor phases	Change to DC injection braking
Motor does not turn Motor is abnormally hot Thermal relay is activated Loud brake noise	Incorrect brake wiring	Check wiring
	Brake gap is too large	Adjust gap
	DC module is broken	Replace or repair
	Broken wiring in brake coil, or short	Send to repair plant
	Poor switch contact	Replace or repair
Abnormal heat	Brake is used frequently	Reduce frequency
	High load torque/inertia	Reduce load

The above table shows the most common problems in daily operation, and their countermeasures. For problems other than these, please contact your dealer.

When you make an inquiry, provide the dealer with the following information from the nameplate.

- (1) Serial number (MFG NO.)
- (2) Model number (TYPE)
- (3) Motor capacity (POWER)
- (4) Reduction ratio (RATIO) or revolution speed (OUTPUT SPEED)
- (5) Drawing number (DRAWING NO.)

A series of horizontal dotted lines for writing notes.

Safety Precautions

Caution

General

- Strictly observe the relevant safety regulations related to installation location and the equipment to be used. (Occupational safety and health regulations, electrical equipment technical standards, building codes, etc.)
- Read the instruction manual thoroughly beforehand, and always refer to it to use the equipment correctly. If you do not have a copy of the instruction manual, please request one from the dealer where the product was purchased or from Tsubaki. Make certain that the instruction manual is provided to the customer who will use the product.
- The product information in this catalog is mainly for helping select the right product. Before using a product, read the instruction manual thoroughly and always refer to it to use the equipment correctly.

Selection

- Choose a product that is suitable for both the intended use and the operation environment.
- When using a product in equipment for the transport of people or in elevator equipment, install the necessary protective equipment to maintain safety.
- In explosive environments, use explosion-proof motor models. Furthermore, use an explosion-proof motor model with specifications that are suitable to the dangerous place.
- When operating an explosion-proof motor with an inverter, a 1:1 motor and inverter combination is permitted. Furthermore, the inverter itself is not explosion proof, so always operate it in a place that is free of explosive gas.
- When operating a motor with a 400 V-class inverter, install a control filter or a reactor with the inverter, or else apply strengthened insulation to the motor.
- If the product is used in equipment for which oil leakage should be particularly avoided, such as food processing machines, install an oil pan or similar device in preparation for unexpected oil leakage due to breakdowns, end of product life, or other reasons.

Warranty

1. Warranty period

This period of warranty shall be 18 months from the time of shipment or 12 months from the time the product was first used (including completed assembly of this product to the equipment of the customer), whichever is shorter. Please note, however, that there may be charges in certain cases.

2. Scope of warranty

If the product malfunctions during the warranty period despite correct installation, operation, and maintenance by the customer according to the product catalog or instruction manual, the malfunctioning part(s) shall be replaced or repaired at no cost once the Tsubaki product has been returned to Tsubaki.

However, the warranty only covers the Tsubaki product purchased by the customer and does not include the following costs. (This includes special instructions to the customer that are written in the instruction manual.)

- (1) Costs required to remove or install the product for replacement or repair from the customer's equipment and any associated work costs.
- (2) Costs required to transport the product to the location for repair.
- (3) Any lost profits or financial damages incurred by the customer as a result of the product's malfunction or its need to be repaired.

3. Repairs outside of warranty

If the product malfunctions due to any of the following situations, even within the warranty period, the product will be examined and repaired at a cost to the customer.

- (1) The customer did not correctly install the product in accordance with the instruction manual.
- (2) The customer did not provide proper maintenance and did not operate the product correctly.
- (3) The product malfunctioned due to a problem with it being connected to another device.
- (4) The construction of the product was changed due to alterations by the customer.
- (5) The product was repaired by a company other than Tsubaki or by a company not specified by Tsubaki.
- (6) The product was used outside the proper operation environment as specified in the instruction manual.
- (7) The product malfunctioned due to disasters or other acts of God, or unlawful acts by a third party.
- (8) A malfunction on the customer's equipment caused secondary damage to the product.
- (9) The product malfunctioned due to parts received and mounted by the customer, or parts specified and used by the customer.
- (10) The product malfunctioned due to faulty wiring by the customer or faulty parameter settings input by the customer.
- (11) The product has reached the end of its service life due to usage conditions.
- (12) Damage occurs due to factors outside the responsibility of Tsubaki.

4. Dispatch of Tsubaki engineers

Customers will be charged for services such as examination, adjustment, and trial operation performed by Tsubaki engineers dispatched to the customer's location.

Caution

The product information in this catalog is mainly for helping select the right product. Before using a product, read the instruction manual thoroughly and always refer to it to use the equipment correctly.
